“Polynomial convergence rate to nonequilibrium steady-state”

**Professor Yao Li
Department of Mathematics and Statistics
University of Massachusetts Amherst**

Abstract

In this talk, I will present my recent result about the ergodic properties of nonequilibrium steady-state (NESS) for a stochastic energy exchange model. The energy exchange model can be seen as a stochastic approximation of a certain billiards-like deterministic particle system that models the microscopic heat conduction in a 1D chain. By using a technique called the induced chain method, I proved the existence, uniqueness, polynomial speed of convergence to the NESS, and polynomial speed of mixing for the stochastic energy exchange model. All of these are consistent with the numerical simulation results of the original deterministic billiards-like system.

Refreshments will be served in CAB 649 at 1:30 p.m.
