# A TRANSFERENCE THEOREM FOR THE DUNKL TRANSFORM AND ITS APPLICATIONS 

FENG DAI AND HEPING WANG

#### Abstract

For a family of weight functions invariant under a finite reflection group, we show how weighted $L^{p}$ multiplier theorems for Dunkl transform on the Euclidean space $\mathbb{R}^{d}$ can be transferred from the corresponding results for $h$ harmonic expansions on the unit sphere $\mathbb{S}^{d}$ of $\mathbb{R}^{d+1}$. The result is then applied to establish a Hörmander type multiplier theorem for the Dunkl transform and to show the convergence of the Bochner -Riesz means of the Dunkl transform of order above the critical index in weighted $L^{p}$ spaces.

## 1. Introduction

Let $R$ be a reduced root system in $\mathbb{R}^{d}$ normalized so that $\langle\alpha, \alpha\rangle=2$ for all $\alpha \in R$, where $\langle\cdot, \cdot\rangle$ denotes the standard Euclidean inner product. Given a nonzero vector $\alpha \in \mathbb{R}^{d}$, we denote by $\sigma_{\alpha}$ the reflection with respect to the hyperplane perpendicular to $\alpha$; that is, $\sigma_{\alpha} x=x-2\left(\langle x, \alpha\rangle /\|\alpha\|^{2}\right) \alpha$ for all $x \in \mathbb{R}^{d}$, where $\|\cdot\|$ denotes the usual Euclidean norm. Let $G$ denote the finite subgroup of the orthogonal group $O(d)$ generated by the reflections $\sigma_{\alpha}, \alpha \in R$. Let $\kappa: R \rightarrow \mathbb{R}_{+}$be a nonnegative multiplicity function on $R$ with the property $\kappa(g \alpha)=\kappa(\alpha)$ for all $\alpha \in R$ and $g \in G$. Associated with the reflection group $G$ and the function $\kappa$ is the weight function $h_{\kappa}$ defined by

$$
\begin{equation*}
h_{\kappa}(x):=\prod_{\alpha \in R_{+}}|\langle x, \alpha\rangle|^{\kappa(\alpha)}, \quad x \in \mathbb{R}^{d}, \tag{1.1}
\end{equation*}
$$

where $R_{+}$is an arbitrary but fixed positive subsystem of $R$. The function $h_{\kappa}$ is a homogeneous function of degree $\gamma_{\kappa}:=\sum_{\alpha \in R_{+}} \kappa(\alpha)$, and is invariant under the reflection group $G$. For convenience, we shall set $\lambda_{\kappa}=\frac{d-1}{2}+\gamma_{\kappa}$ for the rest of the paper. Given $1 \leq p \leq \infty$, we denote by $L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ the weighted Lebesgue space endowed with the norm

$$
\|f\|_{\kappa, p}:=\left(\int_{\mathbb{R}^{d}}|f(y)|^{p} h_{\kappa}^{2}(y) d y\right)^{\frac{1}{p}}
$$

with the usual change when $p=\infty$.

[^0]The Dunkl transform, a generalization of the classical Fourier transform, is defined, for $f \in L^{1}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$, by

$$
\begin{equation*}
\mathcal{F}_{\kappa} f(x)=c_{\kappa} \int_{\mathbb{R}^{d}} f(y) E_{\kappa}(-i x, y) h_{\kappa}^{2}(y) d y, \quad x \in \mathbb{R}^{d} \tag{1.2}
\end{equation*}
$$

where $c_{\kappa}=\left(\int_{\mathbb{R}^{d}} h_{\kappa}^{2}(x) e^{-\frac{\|x\|^{2}}{2}} d x\right)^{-1}$, and $E_{\kappa}(i x, y)=V_{\kappa}\left[e^{i\langle x, \cdot\rangle}\right](y)$ is the weighted analogue of the character $e^{i\langle x, y\rangle}$. Here $V_{\kappa}$ is the Dunkl intertwining operator, whose precise definition will be given in Section 2. The Dunkl transform plays the same role as the Fourier transform in classical Fourier analysis, and enjoys properties similar to those of the classical Fourier transform. (See [11]).

Several important results in classical Fourier analysis have been extended to the setting of Dunkl transform by Thangavelu and Yuan Xu [20, 19]. The problem, however, turns out to be rather difficult in general. One of the difficulties comes from the fact that the generalized translation operator $\tau_{y}$, which plays the role of the usual translation $f \rightarrow f(\cdot-y)$, is not positive in general (see, for instance, [19, Proposition 3.10]). In fact, even the $L^{p}$ boundedness of $\tau_{y}$ is not established in general (see [20, 19]).

In this paper, we shall first prove a transference theorem (Theorem 3.1) between the $L^{p}$ multiplier of $h$-harmonic expansions on the unit sphere and that of the Dunkl transform. This theorem, combined with the corresponding results on h-harmonic expansions on the unit sphere recently established in $[2,3,4]$, is then applied to establish a Hörmander type multiplier theorem for the Dunkl transform (Theorem 4.1), and to show the convergence of the Bochner -Riesz means in the weighted $L^{p}$ spaces (Theorem 4.3).

The paper is organized as follows. In Section 2, we describe briefly some known results on Dunkl transform and $h$-harmonic expansions, which will be needed in later sections. The transference theorem, Theorem 3.1, is proved in Section 3. As applications, we prove Theorems 4.1 and 4.3 in the final section, Section 4.

## 2. Preliminaries

In this section, we shall present some necessary material on the Dunkl transform and the $h$-harmonic expansions, most of which can be found in $[8,11,13,14,19]$.
2.1. The Dunkl transform. Let $R, R_{+}, G, \kappa$ and $h_{\kappa}$ be as defined in Section 1. Recall that a reduced root system is a finite subset $R$ of $\mathbb{R}^{d} \backslash\{0\}$ with the properties $\sigma_{\alpha} R=R$ and $R \cap\{t \alpha: t \in \mathbb{R}\}=\{ \pm \alpha\}$ for all $\alpha \in R$. The Dunkl operators associated with $G$ and $\kappa$ are defined by

$$
\begin{equation*}
\mathcal{D}_{\kappa, i} f(x)=\partial_{i} f(x)+\sum_{\alpha \in R_{+}} \kappa(\alpha) \frac{f(x)-f(\sigma(\alpha) x)}{\langle x, \alpha\rangle}\left\langle\alpha, e_{i}\right\rangle, \quad 1 \leq i \leq d \tag{2.1}
\end{equation*}
$$

where $e_{1}, \cdots, e_{d}$ are the standard unit vectors of $\mathbb{R}^{d}$. Those operators mutually commute, and map $\mathbb{P}_{n}^{d}$ to $\mathbb{P}_{n-1}^{d}$, where $\mathbb{P}_{n}^{d}$ is the space of homogeneous polynomials of degree $n$ in $d$ variables. We denote by $\Pi^{d}:=\Pi\left(\mathbb{R}^{d}\right)$ the $\mathbb{C}$-algebra of polynomial functions on $\mathbb{R}^{d}$. An important result in Dunkl theory states that there exists a linear operator $V_{\kappa}: \Pi^{d} \rightarrow \Pi^{d}$ determined uniquely by

$$
\begin{equation*}
V_{\kappa}\left(\mathbb{P}_{n}^{d}\right) \subset \mathbb{P}_{n}^{d}, \quad V_{\kappa}(1)=1, \quad \text { and } \quad \mathcal{D}_{\kappa, i} V_{\kappa}=V_{\kappa} \partial_{i}, \quad 1 \leq i \leq d \tag{2.2}
\end{equation*}
$$

Such an operator is called the intertwining operator. A very useful explicit formula for $V_{\kappa}$ was obtained by C. F. Dunkl [6] in the case of $G=\mathbb{Z}_{2}$, and was later extended to the more general case of $G=\mathbb{Z}_{2}^{d},(d \in \mathbb{N})$ by Xuan Xu [23]. In general, one has the following important result of Rösler [13]:

Lemma 2.1. [13, Th. 1.2 and Cor. 5.3] For every $x \in \mathbb{R}^{d}$, there exists a unique probability measure $\mu_{x}^{\kappa}$ on the Borel $\sigma$-algebra of $\mathbb{R}^{d}$ such that

$$
\begin{equation*}
V_{\kappa} P(x)=\int_{\mathbb{R}^{d}} P(\xi) d \mu_{x}^{\kappa}(\xi), \quad P \in \Pi^{d} \tag{2.3}
\end{equation*}
$$

Furthermore, the representing measures $\mu_{x}^{\kappa}$ are compactly supported in the convex hull $C(x):=\operatorname{co}\{g x: g \in G\}$ of the orbit of $x$ under $G$, and satisfy

$$
\begin{equation*}
\mu_{r x}^{\kappa}(E)=\mu_{x}^{\kappa}\left(r^{-1} E\right), \quad \text { and } \mu_{g x}^{\kappa}(E)=\mu_{x}^{\kappa}\left(g^{-1} E\right) \tag{2.4}
\end{equation*}
$$

for all $r>0, g \in G$ and each Borel subset $E$ of $\mathbb{R}^{d}$.
In particular, the above lemma shows that the intertwining operator $V_{\kappa}$ is positive. We point out that Lemma 2.1 will play a crucial role in the analysis of our paper.

By means of (2.3), $V_{\kappa}$ can be extended to the space $C\left(\mathbb{R}^{d}\right)$ of continuous functions on $\mathbb{R}^{d}$. We denote this extension by $V_{\kappa}$ again.

The Dunkl transform associated with $G$ and $\kappa$ is defined by (1.2) with

$$
\begin{equation*}
E_{\kappa}(-i x, y):=V_{\kappa}\left[e^{-i\langle x, \cdot\rangle}\right](y), \quad x, y \in \mathbb{R}^{d} \tag{2.5}
\end{equation*}
$$

If $\kappa=0$ then $V_{\kappa}=\mathrm{id}$ and the Dunkl transform coincides with the usual Fourier transform, whereas if $d=1$ and $G=\mathbb{Z}_{2}$ then it is closely related to the Hankel transform on the real line.

We list some of the known properties of the Dunkl transform in the following lemma.
Lemma 2.2. [7, 11] (i) If $f \in L^{1}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ then $\mathcal{F}_{\kappa} f \in C\left(\mathbb{R}^{d}\right)$ and $\lim _{\|\xi\| \rightarrow \infty} \mathcal{F}_{\kappa} f(\xi)=0$.
(ii) The Dunkl transform $\mathcal{F}_{\kappa}$ is an isomorphism of the Schwartz class $\mathcal{S}\left(\mathbb{R}^{d}\right)$ onto itself, and $\mathcal{F}_{\kappa}^{2} f(x)=f(-x)$.
(iii) The Dunkl transform $\mathcal{F}_{\kappa}$ on $\mathcal{S}\left(\mathbb{R}^{d}\right)$ extends uniquely to an isometric isomorphism on $L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$, i.e., $\|f\|_{\kappa, 2}=\left\|\mathcal{F}_{\kappa} f\right\|_{\kappa, 2}$.
(iv) If $f$ and $\mathcal{F}_{\kappa} f$ are both in $L^{1}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ then the following inverse formula holds:

$$
f(x)=c_{\kappa} \int_{\mathbb{R}^{d}} \mathcal{F}_{\kappa} f(y) E_{\kappa}(i x, y) h_{\kappa}^{2}(y) d y, \quad x \in \mathbb{R}^{d}
$$

(v) If $f, g \in L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ then

$$
\int_{\mathbb{R}^{d}} \mathcal{F}_{\kappa} f(x) g(x) h_{\kappa}^{2}(x) d x=\int_{\mathbb{R}^{d}} f(x) \mathcal{F}_{\kappa} g(x) h_{\kappa}^{2}(x) d x .
$$

(vi) Given $\varepsilon>0$, let $f_{\varepsilon}(x)=\varepsilon^{-2-2 \gamma_{\kappa}} f\left(\varepsilon^{-1} x\right)$. Then $\mathcal{F}_{\kappa} f_{\varepsilon}(\xi)=\mathcal{F}_{\kappa} f(\varepsilon \xi)$.
(vii) If $f(x)=f_{0}(\|x\|)$ is radial, then $\mathcal{F}_{\kappa} f(\xi)=H_{\lambda_{\kappa}-\frac{1}{2}} f_{0}(\|\xi\|)$ is again a radial function, where $H_{\alpha}$ denotes the Hankel transform defined by

$$
H_{\alpha} g(s)=\frac{1}{\Gamma(\alpha+1)} \int_{0}^{\infty} g(r) \frac{J_{\alpha}(r s)}{(r s)^{\alpha}} r^{2 \alpha+1} d r
$$

and $J_{\alpha}$ denotes the Bessel function of the first kind.

Statements (i)-(vi) of Lemma 2.2 above were proved by M. F. E. de Jeu [11], and were, in fact, contained in Corollaries 4.7 and 4.22, Theorems 4.26 and 4.20, Lemmas 4.13 and 4.3 (3) of [11], respectively. Statement (vii) of Lemma 2.2 was proved by Dunkl [7] and was stated more explicitly in [19, Proposition 2.4].

Given $y \in \mathbb{R}^{d}$, the generalized translation operator $f \rightarrow \tau_{y} f$ is defined on $L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ by

$$
\mathcal{F}_{\kappa}\left(\tau_{y} f\right)(\xi)=E_{\kappa}(-i \xi, y) \mathcal{F}_{\kappa} f(\xi), \quad \xi \in \mathbb{R}^{d}
$$

It is known that $\tau_{y} f(x)=\tau_{x} f(y)$ for a.e. $x \in \mathbb{R}^{d}$ and a.e. $y \in \mathbb{R}^{d}$. In general, the operator $\tau_{y}$ is not positive (see, for instance, [19, Proposition 3.10]), and it is still an open problem whether $\tau_{y} f$ can be extended to a bounded operator on $L^{1}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$. On the other hand, however, it was shown in [19, Theorem 3.7] that the generalized translation operator $\tau_{y}$ can be extended to all radial functions in $L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right), 1 \leq p \leq 2$, and $\tau_{y}: L_{\mathrm{rad}}^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right) \rightarrow L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ is a bounded operator, where $L_{\mathrm{rad}}^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ denotes the space of all radial functions in $L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$.

The generalized convolution of $f, g \in L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ is defined by

$$
\begin{equation*}
f *_{\kappa} g(x)=\int_{\mathbb{R}^{d}} f(y) \tau_{x} \widetilde{g}(y) h_{\kappa}^{2}(y) d y \tag{2.6}
\end{equation*}
$$

where $\widetilde{g}(y)=g(-y)$. Since $\tau_{y}$ is a bounded operator from $L_{\mathrm{rad}}^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ to $L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ for $1 \leq p \leq 2$, it follows that the definition of $f *_{\kappa} g$ can be extended to all $g \in L_{\mathrm{rad}}^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ and $f \in L^{p^{\prime}}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ with $1 \leq p \leq 2$ and $\frac{1}{p}+\frac{1}{p^{\prime}}=1$. The generalized convolution satisfies the following basic property

$$
\begin{equation*}
\mathcal{F}_{\kappa}\left(f *_{\kappa} g\right)(\xi)=\mathcal{F}_{\kappa} f(\xi) \mathcal{F}_{\kappa} g(\xi) \tag{2.7}
\end{equation*}
$$

More properties on the generalized translation operator and the generalized convolution can be found in [19].
2.2. $h$-harmonic expansions. Let $\mathbb{S}^{d-1}=\left\{x \in \mathbb{R}^{d}:\|x\|=1\right\}$ denote the unit sphere of $\mathbb{R}^{d}$ equipped with the usual Lebesgue measure $d \sigma(x)$. For the weight function $h_{\kappa}$ given in (1.1), we consider the weighted Lebesgue space $L^{p}\left(h_{\kappa}^{2} ; \mathbb{S}^{d-1}\right)$ of functions on $\mathbb{S}^{d-1}$ endowed with the finite norm

$$
\|f\|_{L^{p}\left(h_{\kappa}^{2} ; \mathbb{S}^{d-1}\right)} \equiv\|f\|_{\kappa, p}:=\left(\int_{\mathbb{S}^{d-1}}|f(y)|^{p} h_{\kappa}^{2}(y) d \sigma(y)\right)^{1 / p}, \quad 1 \leq p<\infty
$$

and for $p=\infty$ we assume that $L^{\infty}$ is replaced by $C\left(\mathbb{S}^{d-1}\right)$, the space of continuous functions on $\mathbb{S}^{d-1}$ with the usual uniform norm $\|f\|_{\infty}$. We shall use the notation $\|\cdot\|_{\kappa, p}$ to denote the weighted norm for functions defined either on $\mathbb{R}^{d}$ or on $\mathbb{S}^{d-1}$ whenever it causes no confusion.

A homogeneous polynomial is called an $h$-harmonic if it is orthogonal to all polynomials of lower degree with respect to the inner product of $L^{2}\left(h_{\kappa}^{2} ; \mathbb{S}^{d-1}\right)$. Let $\mathcal{H}_{n}^{d}\left(h_{\kappa}^{2}\right)$ denote the space of all $h$-harmonics of degree $n$, and let proj${ }_{n}^{\kappa}$ : $L^{2}\left(h_{\kappa}^{2} ; \mathbb{S}^{d-1}\right) \rightarrow \mathcal{H}_{n}^{d}\left(h_{\kappa}^{2}\right)$ denote the orthogonal projection operator. The projection $\operatorname{proj}_{n}^{\kappa}$ has an integral representation

$$
\begin{equation*}
\operatorname{proj}_{n}^{\kappa} f(x):=\int_{\mathbb{S}^{d-1}} f(y) P_{n}^{\kappa}(x, y) h_{\kappa}^{2}(y) d \sigma(y), x \in \mathbb{S}^{d-1} \tag{2.8}
\end{equation*}
$$

where $P_{n}^{\kappa}(x, y)$ is the reproducing kernel of $\mathcal{H}_{n}^{d}\left(h_{\kappa}^{2}\right)$ which can be written in terms of the interwining operator $V_{\kappa}$ as (see [22, Theorem 3.2, (3.1)])

$$
\begin{equation*}
P_{n}^{\kappa}(x, y)=\frac{n+\lambda_{k}^{\prime}}{\lambda_{\kappa}^{\prime}} V_{\kappa}\left[C_{n}^{\lambda_{k}^{\prime}}(\langle x, \cdot\rangle)\right](y), \quad x, y \in \mathbb{S}^{d-1} \tag{2.9}
\end{equation*}
$$

with $\lambda_{\kappa}^{\prime}:=\lambda_{\kappa}-\frac{1}{2}=\gamma_{\kappa}+\frac{d-2}{2}$. Here $C_{n}^{\lambda}$ denotes the standard Gegenbauer polynomial of degree $n$ and index $\lambda$ as defined in [18]. By means of (2.8) and (2.9), the projection $\operatorname{proj}_{n}^{\kappa} f$ can be extended to all $f \in L^{1}\left(h_{\kappa}^{2} ; \mathbb{S}^{d-1}\right)$.

The following Marcinkiewitcz type multiplier theorem was proved recently in [2, Theorem 2.3]:

Theorem 2.3. Let $\left\{\mu_{j}\right\}_{j=0}^{\infty}$ be a sequence of real numbers that satisfies
(i) $\sup _{j}\left|\mu_{j}\right| \leq c<\infty$,
(ii) $\sup _{j \geq 1} 2^{j(r-1)} \sum_{l=2^{j}}^{2^{j+1}}\left|\Delta^{r} \mu_{l}\right| \leq c<\infty$, with $r$ being the smallest integer $\geq \frac{d}{2}+\gamma_{\kappa}$, where $\triangle \mu_{l}=\mu_{l}-\mu_{l+1}$ and $\triangle^{j+1} \mu_{l}=\triangle^{j} \mu_{l}-\triangle^{j} \mu_{l+1}$. Then $\left\{\mu_{j}\right\}$ defines an $L^{p}\left(h_{\kappa}^{2} ; \mathbb{S}^{d-1}\right)$ multiplier for all $1<p<\infty$; that is,

$$
\left\|\sum_{j=0}^{\infty} \mu_{j} \operatorname{proj}_{j}^{\kappa} f\right\|_{\kappa, p} \leq A_{p} c\|f\|_{\kappa, p}, \quad 1<p<\infty
$$

where $A_{p}$ is independent of $\left\{\mu_{j}\right\}$ and $f$.
When $\kappa=0$, the theorem becomes part (1) of [1, Theorem 4.9] on the ordinary spherical harmonic expansions.

For $\delta>-1$, the Cesàro $(C, \delta)$ means of the $h$-harmonic expansion are defined by

$$
S_{n}^{\delta}\left(h_{\kappa}^{2} ; f, x\right):=\left(A_{n}^{\delta}\right)^{-1} \sum_{k=0}^{n} A_{n-k}^{\delta} \operatorname{proj}_{k}^{\kappa} f(x), \quad A_{n-k}^{\delta}=\binom{n-k+\delta}{n-k}
$$

In the case when $G=\mathbb{Z}_{2}^{d}$ and $h_{\kappa}(x)=\prod_{i=1}^{d}\left|\left\langle x, e_{i}\right\rangle\right|^{\kappa\left(e_{i}\right)}$, the following result was proved recently in [3]:
Theorem 2.4. Let $G=\mathbb{Z}_{2}^{d}$ and let $1 \leq p \leq \infty$ satisfy $\left|\frac{1}{p}-\frac{1}{2}\right| \geq \frac{1}{2 \sigma_{\kappa}+2}$ with

$$
\sigma_{\kappa}:=\frac{d-2}{2}+\gamma_{\kappa}-\min _{1 \leq i \leq d} \kappa\left(e_{i}\right) .
$$

Then

$$
\sup _{n \in \mathbb{N}}\left\|S_{n}^{\delta}\left(h_{\kappa}^{2} ; f\right)\right\|_{\kappa, p} \leq c\|f\|_{\kappa, p} \quad \text { for all } f \in L^{p}\left(h_{\kappa}^{2} ; \mathbb{S}^{d-1}\right)
$$

if and only if

$$
\begin{equation*}
\delta>\delta_{\kappa}(p):=\max \left\{\left(2 \sigma_{\kappa}+1\right)\left|\frac{1}{p}-\frac{1}{2}\right|-\frac{1}{2}, 0\right\} . \tag{2.10}
\end{equation*}
$$

## 3. A TRANSFERENCE THEOREM

The main goal in this section is to establish a transference theorem between the $L^{p}$ multipliers of $h$-harmonic expansions on the unit sphere $\mathbb{S}^{d}:=\left\{x \in \mathbb{R}^{d+1}\right.$ : $\|x\|=1\}$ and those of the Dunkl transform in $\mathbb{R}^{d}$. Let $G, R, h_{\kappa}$ be as defined in

Section 1. Given $g \in G$, we denote by $g^{\prime}$ the orthogonal transformation on $\mathbb{R}^{d+1}$ determined uniquely by

$$
g^{\prime} x^{\prime}=\left(g x, x_{d+1}\right) \text { for } x^{\prime}=\left(x, x_{d+1}\right) \text { with } x \in \mathbb{R}^{d} \text { and } x_{d+1} \in \mathbb{R}
$$

Then $G^{\prime}:=\left\{g^{\prime}: g \in G\right\}$ is a finite reflection group on $\mathbb{R}^{d+1}$ with a reduced root system $R^{\prime}:=\{(\alpha, 0): \alpha \in R\}$. Let $\kappa^{\prime}$ denote the nonnegative multiplicity function defined on $R^{\prime}$ with the property $\kappa^{\prime}(\alpha, 0)=\kappa(\alpha)$. We denote by $V_{\kappa^{\prime}}$ the intertwining operator on $C\left(\mathbb{R}^{d+1}\right)$ associated with the reflection group $G^{\prime}$ and the multiplicity function $\kappa^{\prime}$. Define the weight function

$$
h_{\kappa^{\prime}}\left(x, x_{d+1}\right):=h_{\kappa}(x)=\prod_{\alpha \in R_{+}}|\langle x, \alpha\rangle|^{\kappa(\alpha)}, \quad x \in \mathbb{R}^{d}, x_{d+1} \in \mathbb{R} .
$$

Recall that $\operatorname{proj}_{n}^{\kappa^{\prime}}: L^{2}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right) \rightarrow \mathcal{H}_{n}^{d+1}\left(h_{\kappa^{\prime}}^{2}\right)$ denotes the orthogonal projection onto the space of $h$-harmonics.

Our main result is the following.
Theorem 3.1. Let $m:[0, \infty) \rightarrow \mathbb{R}$ be a continuous and bounded function, and let $U_{\varepsilon}, \varepsilon>0$, be a family of operators on $L^{2}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right)$ given by

$$
\begin{equation*}
\operatorname{proj}_{n}^{\kappa^{\prime}}\left(U_{\varepsilon} f\right)=m(\varepsilon n) \operatorname{proj}_{n}^{\kappa^{\prime}} f, \quad n=0,1, \cdots \tag{3.1}
\end{equation*}
$$

Assume that

$$
\begin{equation*}
\sup _{\varepsilon>0}\left\|U_{\varepsilon} f\right\|_{L^{p}\left(\mathbb{S}^{d} ; h_{k^{\prime}}^{2}\right)} \leq A\|f\|_{L^{p}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right)}, \quad \forall f \in C\left(\mathbb{S}^{d}\right) \tag{3.2}
\end{equation*}
$$

for some $1 \leq p \leq \infty$. Then the function $m(\|\cdot\|)$ defines an $L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ multiplier; that is,

$$
\left\|T_{m} f\right\|_{L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)} \leq c_{d, \kappa} A\|f\|_{L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)}, \quad \forall f \in \mathcal{S}\left(\mathbb{R}^{d}\right)
$$

where $T_{m}$ is an operator initially defined on $L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ by

$$
\begin{equation*}
\mathcal{F}_{\kappa}\left(T_{m} f\right)(\xi)=m(\|\xi\|) \mathcal{F}_{\kappa} f(\xi), \quad f \in L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right), \quad \xi \in \mathbb{R}^{d} \tag{3.3}
\end{equation*}
$$

In the case of ordinary spherical harmonics (i.e., $\kappa=0$ ), Theorem 3.1 is due to Bonami and Clerc [1, Theorem 1.1].
3.1. Lemmas. The proof of Theorem 3.1 relies on several lemmas.

Lemma 3.2. If $f \in \Pi^{d+1}$ then for any $x \in \mathbb{R}^{d}$ and $x_{d+1} \in \mathbb{R}$,

$$
\begin{equation*}
V_{\kappa^{\prime}} f\left(x, x_{d+1}\right)=V_{\kappa}\left[f\left(\cdot, x_{d+1}\right)\right](x)=\int_{\mathbb{R}^{d}} f\left(\xi, x_{d+1}\right) d \mu_{x}^{\kappa}(\xi) \tag{3.4}
\end{equation*}
$$

where $d \mu_{x}^{\kappa}$ is given in (2.3).
Proof. Clearly, the second equality in (3.4) follows directly from (2.3). To show the first equality, we set $\widetilde{V}_{\kappa} f\left(x, x_{d+1}\right)=V_{\kappa}\left[f\left(\cdot, x_{d+1}\right)\right](x)$ for $f \in C\left(\mathbb{R}^{d+1}\right)$ and $x \in \mathbb{R}^{d}$. Since $V_{\kappa^{\prime}}$ is a linear operator uniquely determined by (2.2), it suffices to show that the following conditions are satisfied:

$$
\widetilde{V}_{\kappa}\left(\mathbb{P}_{n}^{d+1}\right) \subset \mathbb{P}_{n}^{d+1}, \quad \widetilde{V}_{\kappa}(1)=1 \quad \text { and } \quad \mathcal{D}_{\kappa^{\prime}, i} \tilde{V}_{\kappa}=\widetilde{V}_{\kappa} \partial_{i}, \quad 1 \leq i \leq d+1
$$

Indeed, these conditions can be easily verified using the properties of $V_{\kappa}$ in (2.2), and the following identities, which follow directly from (2.1):

$$
\begin{aligned}
\mathcal{D}_{\kappa^{\prime}, i} g\left(x, x_{d+1}\right) & =\mathcal{D}_{\kappa, i}\left[g\left(\cdot, x_{d+1}\right)\right](x), \quad 1 \leq i \leq d \\
\mathcal{D}_{\kappa^{\prime}, d+1} g\left(x, x_{d+1}\right) & =\partial_{d+1} g\left(x, x_{d+1}\right), \quad \text { for } g \in \Pi^{d+1}, x \in \mathbb{R}^{d} \text { and } x_{d+1} \in \mathbb{R} .
\end{aligned}
$$

This completes the proof of Lemma 3.2.
To formulate the next lemma, we define the mapping $\psi: \mathbb{R}^{d} \rightarrow \mathbb{S}^{d}$ by

$$
\psi(x):=(\xi \sin \|x\|, \cos \|x\|) \quad \text { for } x=\|x\| \xi \in \mathbb{R}^{d} \text { and } \xi \in \mathbb{S}^{d-1}
$$

Given $N \geq 1$, we denote by $N \mathbb{S}^{d}:=\left\{x \in \mathbb{R}^{d+1}:\|x\|=N\right\}$ the sphere of radius $N$ in $\mathbb{R}^{d+1}$, and define the mapping $\psi_{N}: \mathbb{R}^{d} \rightarrow N \mathbb{S}^{d}$ by

$$
\begin{equation*}
\psi_{N}(x):=N \psi\left(\frac{x}{N}\right)=\left(N \xi \sin \frac{\|x\|}{N}, N \cos \frac{\|x\|}{N}\right) \tag{3.5}
\end{equation*}
$$

with $x=\|x\| \xi \in \mathbb{R}^{d}$ and $\xi \in \mathbb{S}^{d-1}$.
Lemma 3.3. If $f: N \mathbb{S}^{d} \rightarrow \mathbb{R}$ is supported in the set $\left\{x \in N \mathbb{S}^{d}: \arccos \left(N^{-1} x_{d+1}\right) \leq\right.$ $1\}$, then

$$
\int_{\mathbb{S}^{d}} f(N x) h_{\kappa^{\prime}}^{2}(x) d \sigma(x)=N^{-2 \lambda_{\kappa}-1} \int_{B(0, N)} f\left(\psi_{N}(x)\right) h_{\kappa}^{2}(x)\left(\frac{\sin (\|x\| / N)}{\|x\| / N}\right)^{2 \lambda_{\kappa}} d x
$$

where $B(0, N)=\left\{y \in \mathbb{R}^{d}:\|y\| \leq N\right\}$.
Proof. First, using the polar coordinate transformation

$$
(\xi, \theta) \in \mathbb{S}^{d-1} \times[0, \pi] \rightarrow x:=(\xi \sin \theta, \cos \theta) \in \mathbb{S}^{d}
$$

and the fact that $d \sigma(x)=\sin ^{d-1} \theta d \theta d \sigma(\xi)$, we obtain

$$
\begin{aligned}
& \int_{\mathbb{S}^{d}} f(N x) h_{\kappa^{\prime}}^{2}(x) d \sigma(x)=\int_{0}^{\pi}\left[\int_{\mathbb{S}^{d-1}} f(N \xi \sin \theta, N \cos \theta) h_{\kappa^{\prime}}^{2}(\xi \sin \theta, \cos \theta) d \sigma(\xi)\right](\sin \theta)^{d-1} d \theta \\
& =\int_{0}^{1} \int_{\mathbb{S}^{d-1}} f(N \xi \sin \theta, N \cos \theta) h_{\kappa}^{2}(\theta \xi) d \sigma(\xi)\left(\frac{\sin \theta}{\theta}\right)^{d-1+2 \gamma_{\kappa}} \theta^{d-1} d \theta
\end{aligned}
$$

where the last step uses the identity $h_{\kappa^{\prime}}\left(y, y_{d+1}\right)=h_{\kappa}(y)$, the fact that $h_{\kappa}^{2}$ is a homogeneous function of degree $2 \gamma_{\kappa}$, and the assumption that $f$ is supported in the set $\left\{x \in N \mathbb{S}^{d}: \arccos \left(N^{-1} x_{d+1}\right) \leq 1\right\}$. Using the usual spherical coordinate transformation in $\mathbb{R}^{d}$, the last double integral equals

$$
\begin{aligned}
& \int_{\|y\| \leq 1} f\left(\frac{N y \sin \|y\|}{\|y\|}, N \cos \|y\|\right) h_{\kappa}^{2}(y)\left(\frac{\sin \|y\|}{\|y\|}\right)^{2 \lambda_{\kappa}} d y \\
& =N^{-d-2 \gamma_{\kappa}} \int_{\|x\| \leq N} f\left(N \frac{x}{\|x\|} \sin \frac{\|x\|}{N}, N \cos \frac{\|x\|}{N}\right) h_{\kappa}^{2}(x)\left(\frac{\sin (\|x\| / N)}{\|x\| / N}\right)^{2 \lambda_{\kappa}} d x \\
& =N^{-2 \lambda_{\kappa}-1} \int_{B(0, N)} f\left(\psi_{N} x\right) h_{\kappa}^{2}(x)\left(\frac{\sin (\|x\| / N)}{\|x\| / N}\right)^{2 \lambda_{\kappa}} d x
\end{aligned}
$$

where the first step uses the homogeneity of the weight $h_{\kappa}$ and the change of variables $y=\frac{x}{N}$. This proves the desired formula.

Remark 3.1. It is easily seen that the restriction $\left.\psi_{N}\right|_{B(0, N)}$ of the mapping $\psi_{N}$ on $B(0, N)$ is a bijection from $B(0, N)$ to $\left\{x \in N \mathbb{S}^{d}: \arccos \left(N^{-1} x_{d+1}\right) \leq 1\right\}$. Thus, given a function $f: B(0, N) \rightarrow \mathbb{R}$, there exists a unique function $f_{N}$ supported in $\left\{x \in N \mathbb{S}^{d}: \arccos \left(N^{-1} x_{d+1}\right) \leq 1\right\}$ such that

$$
\begin{equation*}
f_{N}\left(\psi_{N} x\right)=f(x), \quad \forall x \in B(0, N) \tag{3.6}
\end{equation*}
$$

On the other hand, using Lemma 3.3, we have

$$
\begin{equation*}
\int_{\mathbb{S}^{d}} f_{N}(N x) h_{\kappa^{\prime}}^{2}(x) d \sigma(x)=N^{-2 \lambda_{\kappa}-1} \int_{B(0, N)} f(x) h_{\kappa}^{2}(x)\left(\frac{\sin (\|x\| / N)}{\|x\| / N}\right)^{2 \lambda_{\kappa}} d x \tag{3.7}
\end{equation*}
$$

The formula (3.7) will play an important role in our proof of Theorem 3.1.
We also need a small observation on a formula of Rösler [14] for $\tau_{y} f(x)$ :
Lemma 3.4. If $f(x)=f_{0}(\|x\|)$ is a continuous radial function in $L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$, then for a.e. $y \in \mathbb{R}^{d}$ and a.e. $x \in \mathbb{R}^{d}$,

$$
\begin{equation*}
\tau_{y} f(x)=V_{\kappa}\left[f_{0}\left(\sqrt{\|x\|^{2}+\|y\|^{2}-2\|y\|\langle x, \cdot\rangle}\right)\right]\left(\frac{y}{\|y\|}\right) \tag{3.8}
\end{equation*}
$$

Formula (3.8) was first proved in [14] under the assumption that $f$ is a radial Schwartz function. Thangavelu and Yuan Xu [19, Proposition 3.3] later observed that it also holds for radial functions $f \in L\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ with $\mathcal{F}_{\kappa} f \in L\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$. Clearly, our assumption in Lemma 3.4 is slightly weaker than that of [19, Proposition 3.3].

Lemma 3.4 can be deduced from the result of Rösler [14], using a density argument.

Proof. We first choose a sequence of even, $C^{\infty}$ functions $g_{j}$ on $\mathbb{R}$ satisfying

$$
\sup _{|t| \leq 2^{j+1}}\left|g_{j}(t)-f_{0}(t)\right| \leq 2^{-j}\left(\int_{0}^{2^{j}} s^{2 \lambda_{\kappa}} d s\right)^{-\frac{1}{2}}
$$

Let $\varphi_{j}$ be an even, $C^{\infty}$ function on $\mathbb{R}$ such that $\chi_{\left[2^{-j}, 2^{j}\right]}(|t|) \leq \varphi_{j}(t) \leq \chi_{\left[2^{-j-1}, 2^{j+1}\right]}(|t|)$, and let $f_{j}(x) \equiv f_{j, 0}(\|x\|):=g_{j}(\|x\|) \varphi_{j}(\|x\|)$ for $x \in \mathbb{R}^{d}$. Then it's easily seen that $\left\{f_{j}\right\}$ is a sequence of radial Schwartz functions on $\mathbb{R}^{d}$ satisfying

$$
\begin{equation*}
\lim _{j \rightarrow \infty} \sup _{2^{-j} \leq|t| \leq 2^{j}}\left|f_{j, 0}(t)-f_{0}(t)\right|=0 \tag{3.9}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{j \rightarrow \infty}\left\|f_{j}-f\right\|_{\kappa, 2}=0 \tag{3.10}
\end{equation*}
$$

Since each $f_{j}$ is a radial Schwartz function, by Lemma 2.1 and the already proven case of Lemma 3.4 (see [14]), we obtain

$$
\begin{equation*}
\tau_{y}\left(f_{j}\right)(x)=\int_{\|\xi\| \leq 1} f_{j, 0}\left(\sqrt{\|x\|^{2}+\|y\|^{2}-2\|y\|\langle x, \xi\rangle}\right) d \mu_{y /\|y\|}^{\kappa}(\xi) \tag{3.11}
\end{equation*}
$$

Next, we fix $y \in \mathbb{R}^{d}$, and set

$$
A_{n} \equiv A_{n}(y):=\left\{x \in \mathbb{R}^{d}: \quad 2^{-n} \leq|\|x\|-\|y\|| \leq\|x\|+\|y\| \leq 2^{n}\right\}
$$

for $n \in \mathbb{N}$ and $n \geq n_{0}(y):=[\log \|y\| / \log 2]+1$. Since

$$
(\|x\|-\|y\|)^{2} \leq\|x\|^{2}+\|y\|^{2}-2\|y\|\langle x, \xi\rangle \mid \leq(\|x\|+\|y\|)^{2}
$$

for all $\|\xi\| \leq 1$, it follows by (3.9) that

$$
\lim _{j \rightarrow \infty} f_{j, 0}\left(\sqrt{\|x\|^{2}+\|y\|^{2}-2\|y\|\langle x, \xi\rangle}\right)=f_{0}\left(\sqrt{\|x\|^{2}+\|y\|^{2}-2\|y\|\langle x, \xi\rangle}\right)
$$

uniformly for $x \in A_{n}(y)$ and $\|\xi\| \leq 1$. This together with (3.11) and Lemma 2.1 implies

$$
\begin{aligned}
\lim _{j \rightarrow \infty} \tau_{y}\left(f_{j}\right)(x) & =\int_{\|\xi\| \leq 1} f_{0}\left(\sqrt{\|x\|^{2}+\|y\|^{2}-2\|y\|\langle x, \xi\rangle}\right) d \mu_{y /\|y\|}^{\kappa}(\xi) \\
& =V_{\kappa}\left[f_{0}\left(\sqrt{\|x\|^{2}+\|y\|^{2}-2\|y\|\langle x, \cdot\rangle}\right)\right]\left(\frac{y}{\|y\|}\right)
\end{aligned}
$$

for every $x \in A_{n}(y) \backslash\{0\}$ and $n \geq n_{0}(y)$. On the other hand, however, by (3.10), we have

$$
\lim _{j \rightarrow \infty}\left\|\tau_{y}\left(f_{j}\right)-\tau_{y} f\right\|_{\kappa, 2}=0
$$

for all $y \in \mathbb{R}^{d}$. Thus,

$$
\tau_{y}(f)(x)=V_{\kappa}\left[f_{0}\left(\sqrt{\|x\|^{2}+\|y\|^{2}-2\|y\|\langle x, \cdot\rangle}\right)\right]\left(\frac{y}{\|y\|}\right)
$$

for a.e. $x \in A_{n}(y)$ and all $n \geq n_{0}(y)$. Finally, observing that the set

$$
\mathbb{R}^{d} \backslash\left(\bigcup_{n=n_{0}(y)}^{\infty} A_{n}(y)\right)=\left\{x \in \mathbb{R}^{d}:\|x\|=\|y\|\right\}
$$

has measure zero in $\mathbb{R}^{d}$, we deduce the desired conclusion.
Remark 3.2. By (2.4) and the supporting condition of the measure $d \mu_{x}^{\kappa}$, we observe that

$$
\begin{equation*}
V_{\kappa} F(r x)=\int_{\mathbb{R}^{d}} F(r \xi) d \mu_{x}^{\kappa}(\xi), \text { for all } F \in C\left(\mathbb{R}^{d}\right), x \in \mathbb{R}^{d}, \text { and } r>0 \tag{3.12}
\end{equation*}
$$

Thus, (3.8) can be rewritten more symmetrically as

$$
\begin{equation*}
\tau_{y} f(x)=V_{\kappa}\left[f_{0}\left(\sqrt{\|x\|^{2}+\|y\|^{2}-2\langle x, \cdot\rangle}\right)\right](y) \tag{3.13}
\end{equation*}
$$

Lemma 3.5. Let $\Phi \in L^{1}\left(\mathbb{R},|x|^{2 \lambda_{\kappa}}\right)$ be an even, bounded function on $\mathbb{R}$, and let $T_{\Phi}$ be an operator $L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right) \rightarrow L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ defined by

$$
\mathcal{F}_{\kappa}\left(T_{\Phi} f\right)(\xi):=\mathcal{F}_{\kappa} f(\xi) \Phi(\|\xi\|), \quad f \in L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)
$$

Then $T_{\Phi}$ has an integral representation

$$
T_{\Phi} f(x)=\int_{\mathbb{R}^{d}} f(y) K(x, y) h_{\kappa}^{2}(y) d y, \quad \text { for } f \in \mathcal{S}\left(\mathbb{R}^{d}\right) \text { and a.e. } x \in \mathbb{R}^{d}
$$

where

$$
\begin{align*}
& K(x, y)  \tag{3.14}\\
= & c \int_{0}^{\infty} \Phi(s) V_{\kappa}\left[\frac{J_{\lambda_{\kappa}-\frac{1}{2}}\left(s \sqrt{\|x\|^{2}+\|y\|^{2}-2\langle x, \cdot\rangle}\right)}{\left(s \sqrt{\|x\|^{2}+\|y\|^{2}-2\langle x, \cdot\rangle}\right)^{\lambda_{\kappa}-\frac{1}{2}}}\right](y) s^{2 \lambda_{\kappa}} d s .
\end{align*}
$$

Furthermore, $K(x, y)=K(y, x)$ for a.e. $x \in \mathbb{R}^{d}$ and a.e. $y \in \mathbb{R}^{d}$.
Proof. Let $g(x)=H_{\lambda_{\kappa}-\frac{1}{2}} \Phi(\|x\|)$, where $x \in \mathbb{R}^{d}$ and $H_{\alpha}$ denotes the Hankel transform. Since $\Phi$ is an even function in $L^{1}\left(\mathbb{R},|x|^{2 \lambda_{\kappa}}\right) \cap L^{\infty}(\mathbb{R})$, it follows by the properties of the Hankel transform that $g$ is a continuous radial function in $L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ and $\mathcal{F}_{\kappa} g(\xi)=\Phi(\|\xi\|)$. Thus, using (2.7), we have

$$
T_{\Phi} f(x)=f *_{\kappa} g(x)=\int_{\mathbb{R}^{d}} f(y) \tau_{y} g(x) h_{\kappa}^{2}(y) d y
$$

for $f \in L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$. Since $g$ is a continuous radial function in $L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$, by Lemma 3.4 and Remark 3.2 it follows that

$$
\begin{aligned}
K(x, y): & =\tau_{y} g(x)=V_{\kappa}\left[H_{\lambda_{\kappa}-\frac{1}{2}} \Phi\left(\sqrt{\|x\|^{2}+\|y\|^{2}+2\langle x, \cdot\rangle}\right)\right](y) \\
& =c \int_{0}^{\infty} \Phi(s) V_{\kappa}\left[\frac{J_{\lambda_{\kappa}-\frac{1}{2}}\left(s \sqrt{\|x\|^{2}+\|y\|^{2}-2\langle x, \cdot\rangle}\right)}{\left(s \sqrt{\|x\|^{2}+\|y\|^{2}-2\langle x, \cdot}\right)}\right)^{\lambda_{\kappa}-\frac{1}{2}}
\end{aligned}(y) s^{2 \lambda_{\kappa}} d s,
$$

where the last step uses (2.3), the inequality

$$
\left|\Phi(s) \frac{J_{\lambda_{\kappa}-\frac{1}{2}}(r s)}{(r s)^{\lambda_{\kappa}-\frac{1}{2}}}\right| \leq c|\Phi(s)|
$$

and Fubini's theorem. This proves the desired equation (3.14). That $K(x, y)=$ $K(y, x)$ follows from the fact that $\tau_{x} g(y)=\tau_{y} g(x)$.

Our final lemma is a well known result for the ultraspherical polynomials:
Lemma 3.6. [18, (8.1.1), p.192] For $z \in \mathbb{C}$ and $\mu \geq 0$,

$$
\begin{equation*}
\lim _{k \rightarrow \infty} k^{1-2 \mu} C_{k}^{\mu}\left(\cos \frac{z}{k}\right)=\frac{\Gamma\left(\mu+\frac{1}{2}\right)}{\Gamma(2 \mu)}\left(\frac{z}{2}\right)^{-\mu+\frac{1}{2}} J_{\mu-\frac{1}{2}}(z) \tag{3.15}
\end{equation*}
$$

This formula holds uniformly in every bounded region of the complex z-plane.
3.2. Proof of Theorem 3.1. We follow the idea of the proof of Theorem 1.1 of [1]. We first prove the theorem under the additional assumption $|m(t)| \leq c_{1} e^{-c_{2} t}$ for all $t>0$ and some $c_{1}, c_{2}>0$. By Lemma 3.5, the operator $T_{m}$ has an integral representation

$$
T_{m} f(x)=\int_{\mathbb{R}^{d}} f(y) K(x, y) h_{\kappa}^{2}(y) d y
$$

where $K(x, y)$ is given by (3.14) with $\Phi=m$. Thus, it is sufficient to prove that

$$
\begin{equation*}
I:=\left|\int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}} f(y) g(x) K(x, y) h_{\kappa}^{2}(x) h_{\kappa}^{2}(y) d x d y\right| \leq c A \tag{3.16}
\end{equation*}
$$

whenever $f \in L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ and $g \in L^{p^{\prime}}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ both have compact supports and satisfy $\|f\|_{L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)}=\|g\|_{L^{p^{\prime}}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)}=1$.

To this end, we choose a positive number $N$ to be sufficiently large so that the supports of $f$ and $g$ are both contained in the ball $B(0, N)$. By Remark 3.1, there exist functions $f_{N}$ and $g_{N}$ both supported in $\left\{x \in N \mathbb{S}^{d}: \quad \arccos \left(N^{-1} x_{d+1}\right) \leq 1\right\}$ and satisfying

$$
\begin{equation*}
f_{N}\left(\psi_{N}(x)\right)=f(x), \quad g_{N}\left(\psi_{N}(x)\right)=g(x), \quad x \in \mathbb{R}^{d} \tag{3.17}
\end{equation*}
$$

where $\psi_{N}$ is defined by (3.5). It's easily seen from (3.7) that

$$
\left\|f_{N}(N \cdot)\right\|_{L^{p}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right)} \leq c N^{-\frac{2 \lambda_{\kappa}+1}{p}}, \quad\left\|g_{N}(N \cdot)\right\|_{L^{p^{\prime}}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right)} \leq c N^{-\frac{2 \lambda_{\kappa}+1}{p^{\prime}}}
$$

Thus, using (2.8), (2.9), (3.1) and the assumption (3.2) with $\varepsilon=\frac{1}{N}$, we obtain $I_{N}:=N^{2 \lambda_{\kappa}+1}$

$$
\begin{align*}
& \times\left|\int_{\mathbb{S}^{d}} \int_{\mathbb{S}^{d}}\left[\sum_{n=0}^{\infty} m\left(N^{-1} n\right) P_{n}^{\kappa^{\prime}}(x, y)\right] f_{N}(N y) g_{N}(N x) h_{\kappa^{\prime}}^{2}(x) h_{\kappa^{\prime}}^{2}(y) d \sigma(x) d \sigma(y)\right| \\
& \quad \leq c A \tag{3.18}
\end{align*}
$$

where $P_{n}^{\kappa^{\prime}}(x, y)=\frac{n+\lambda_{\kappa}}{\lambda_{\kappa}} V_{\kappa^{\prime}}\left[C_{n}^{\lambda_{\kappa}}(\langle x, \cdot\rangle)\right](y)$. Setting

$$
H_{N}(x, y)=N^{-2 \lambda_{\kappa}-1} \sum_{n=0}^{\infty} m\left(N^{-1} n\right) P_{n}^{\kappa^{\prime}}\left(\psi\left(\frac{x}{N}\right), \psi\left(\frac{y}{N}\right)\right)
$$

and invoking (3.17) and Lemma 3.3, we obtain

$$
\begin{align*}
I_{N}= & \left\lvert\, \int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}} H_{N}(x, y) f(y) g(x) h_{\kappa}^{2}(x) h_{\kappa}^{2}(y)\left(\frac{\sin (\|x\| / N)}{\|x\| / N}\right)^{2 \lambda_{\kappa}}\right.  \tag{3.19}\\
& \left.\times\left(\frac{\sin (\|y\| / N)}{\|y\| / N}\right)^{2 \lambda_{\kappa}} d x d y \right\rvert\, .
\end{align*}
$$

On the other hand, setting
$b_{N}(\rho, x, y)=N^{-2 \lambda_{\kappa}-1} \sum_{n=0}^{\infty} m\left(\frac{n}{N}\right) P_{n}^{\kappa^{\prime}}\left(\psi\left(\frac{x}{N}\right), \psi\left(\frac{y}{N}\right)\right)\left(\int_{\frac{n}{N}}^{\frac{n+1}{N}} t^{2 \lambda_{\kappa}} d t\right)^{-1} \chi_{\left[\frac{n}{N}, \frac{n+1}{N}\right)}(\rho)$,
we have

$$
H_{N}(x, y)=\int_{0}^{\infty} b_{N}(\rho, x, y) \rho^{2 \lambda_{\kappa}} d \rho
$$

Hence, by (3.19),

$$
\begin{align*}
I_{N} & =\mid \int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}}\left[\int_{0}^{\infty} b_{N}(\rho, x, y) \rho^{2 \lambda_{\kappa}} d \rho\right] f(y) g(x) h_{\kappa}^{2}(x) h_{\kappa}^{2}(y)  \tag{3.20}\\
& \left.\times\left(\frac{\sin (\|x\| / N)}{\|x\| / N}\right)^{2 \lambda_{\kappa}}\left(\frac{\sin (\|y\| / N)}{\|y\| / N}\right)^{2 \lambda_{\kappa}} d x d y \right\rvert\,
\end{align*}
$$

The key ingredient in our proof is to show that $\lim _{N \rightarrow \infty} I_{N}=c I$, where $c$ is a constant depending only on $d$ and $\kappa$. In fact, once this is proven, then the desired estimate (3.16) will follow immediately from (3.18).

To show $\lim _{N \rightarrow \infty} I_{N}=c I$, we make the following two assertions:
Assertion 1. For any $N>0$ and $x, y \in \mathbb{R}^{d}$,

$$
\left|b_{N}(\rho, x, y)\right| \leq c e^{-c_{2} \rho}
$$

where $c$ is independent of $x, y$ and $N$.
Assertion 2. For any fixed $x, y \in \mathbb{R}^{d}$ and $\rho>0$,

$$
\begin{equation*}
\lim _{N \rightarrow \infty} b_{N}(\rho, x, y)=c m(\rho) V_{\kappa}\left[\frac{J_{\lambda_{\kappa}-\frac{1}{2}}(\rho u(x, y, \cdot))}{(\rho u(x, y, \cdot))^{\lambda_{\kappa}-\frac{1}{2}}}\right](y) \tag{3.21}
\end{equation*}
$$

where $u(x, y, \xi)=\sqrt{\|x\|^{2}+\|y\|^{2}-2\langle x, \xi\rangle}$, and $c$ is a constant depending only on $d$ and $\kappa$.

For the moment, we take the above two assertions for granted, and proceed with the proof of Theorem 3.1. By Assertion 1 and Hölder's inequality, we can apply the dominated convergence theorem to the integrals in (3.20), and obtain

$$
\lim _{N \rightarrow \infty} I_{N}=\left|\int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}}\left[\int_{0}^{\infty} \lim _{N \rightarrow \infty} b_{N}(\rho, x, y) \rho^{2 \lambda_{\kappa}} d \rho\right] f(y) g(x) h_{\kappa}^{2}(x) h_{\kappa}^{2}(y) d x d y\right|,
$$

which, using Assertion 2, equals

$$
\begin{aligned}
& =c\left|\int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}}\left[\int_{0}^{\infty} m(\rho) V_{\kappa}\left[\frac{J_{\lambda_{\kappa}-\frac{1}{2}}(\rho u(x, y, \cdot))}{(\rho u(x, y, \cdot))^{\lambda_{\kappa}-\frac{1}{2}}}\right](y) \rho^{2 \lambda_{\kappa}} d \rho\right] f(y) g(x) h_{\kappa}^{2}(x) h_{\kappa}^{2}(y) d x d y\right| \\
& =c\left|\int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}} K(x, y) f(y) g(x) h_{\kappa}^{2}(x) h_{\kappa}^{2}(y) d x d y\right|=c I,
\end{aligned}
$$

where the second step uses (3.14). Thus, we have shown the desired relation $\lim _{N \rightarrow \infty} I_{N}=c I$, assuming Assertions 1 and 2.

Now we return to the proofs of Assertions 1 and 2. We start with the proof of Assertion 1. Assume that $\frac{n}{N} \leq \rho<\frac{n+1}{N}$ for some $n \in \mathbb{Z}_{+}$. Then $\left|m\left(\frac{n}{N}\right)\right| \leq$ $c_{1} e^{-c_{2} \frac{n}{N}} \leq c e^{-c_{2} \rho}$, and $\int_{\frac{n}{N}}^{\frac{n+1}{N}} t^{2 \lambda_{\kappa}} d t \geq c N^{-1} \rho^{2 \lambda_{\kappa}}$. Hence,

$$
\begin{aligned}
\left|b_{N}(\rho, x, y)\right| & =N^{-2 \lambda_{\kappa}-1}\left|m\left(\frac{n}{N}\right) P_{n}^{\kappa^{\prime}}\left(\psi\left(\frac{x}{N}\right), \psi\left(\frac{y}{N}\right)\right)\right|\left(\int_{\frac{n}{N}}^{\frac{n+1}{N}} t^{2 \lambda_{\kappa}} d t\right)^{-1} \\
& \left.\leq c N^{-2 \lambda_{\kappa}} \rho^{-2 \lambda_{\kappa}} e^{-c_{2} \rho} \frac{n+\lambda_{\kappa}}{\lambda_{\kappa}} \right\rvert\, V_{\kappa^{\prime}}\left[\left.C_{n}^{\lambda_{\kappa}}\left(\left\langle\psi\left(\frac{x}{N}\right), \cdot\right\rangle\right]\left(\psi\left(\frac{y}{N}\right)\right) \right\rvert\,\right. \\
& \leq c(N \rho)^{-2 \lambda_{\kappa}} e^{-c_{2} \rho} n^{2 \lambda_{\kappa}} \leq c e^{-c_{2} \rho},
\end{aligned}
$$

where we used (2.9) in the second step, and the positivity of $V_{\kappa}$ and the estimate $\left|C_{n}^{\lambda_{\kappa}}(t)\right| \leq c n^{2 \lambda_{\kappa}-1}$ in the third step. This proves Assertion 1.

Next, we show Assertion 2. A straightforward calculation shows that for $\frac{n}{N} \leq$ $\rho \leq \frac{n+1}{N}$ and $\rho>0$,

$$
\left(\int_{\frac{n}{N}}^{\frac{n+1}{N}} t^{2 \lambda_{\kappa}} d t\right)^{-1}=\frac{N}{\rho^{2 \lambda_{\kappa}}}\left(1+o_{\rho}(1)\right), \quad \text { as } N \rightarrow \infty
$$

This implies that for $\frac{n}{N} \leq \rho \leq \frac{n+1}{N}$ and $\rho>0$,

$$
\begin{aligned}
b_{N}(\rho, x, y)= & m(\rho) \frac{n^{2 \lambda_{\kappa}}}{(N \rho)^{2 \lambda_{\kappa}}} n^{-2 \lambda_{\kappa}} P_{n}^{\kappa^{\prime}}\left(\psi\left(\frac{x}{N}\right), \psi\left(\frac{y}{N}\right)\right)\left(1+o_{\rho}(1)\right) \\
= & c m(\rho) n^{-2 \lambda_{\kappa}+1} V_{\kappa^{\prime}}\left[C_{n}^{\lambda_{\kappa}}\left(\left\langle\psi\left(\frac{x}{N}\right), \cdot\right\rangle\right)\right]\left(\frac{y}{\|y\|} \sin \frac{\|y\|}{N}, \cos \frac{\|y\|}{N}\right) \\
& +o_{\rho}(1)
\end{aligned}
$$

where we used the continuity of $m$ in the first step, and the estimate $n^{-2 \lambda_{\kappa}}\left|P_{n}^{\kappa^{\prime}}\left(\psi\left(\frac{x}{N}\right), \psi\left(\frac{y}{N}\right)\right)\right| \leq$ $c$, as well as the fact that $\lim _{N \rightarrow \infty} \frac{n^{2 \lambda_{\kappa}}}{(N \rho)^{2 \lambda_{\kappa}}}=1$ in the last step (see [4]). Thus, using Lemma 3.2 and (3.12), we obtain

$$
\begin{align*}
& b_{N}(\rho, x, y) \\
& =c m(\rho) n^{-2 \lambda_{\kappa}+1} \int_{\mathbb{R}^{d}} C_{n}^{\lambda_{\kappa}}\left(\frac{1}{\|x\|} \sin \frac{\|x\|}{N} \sum_{j=1}^{d} x_{j} \xi_{j}+\cos \frac{\|y\|}{N} \cos \frac{\|x\|}{N}\right) \\
& \quad \times d \mu^{\kappa}{ }_{\frac{y}{y \|} \sin \frac{\|y\|}{N}}(\xi)+o_{\rho}(1) \\
& =c m(\rho) n^{-2 \lambda_{\kappa}+1} \int_{\|\xi\| \leq\|y\|} C_{n}^{\lambda_{\kappa}}\left(\cos \theta_{N}(x, y, \xi)\right) d \mu_{y}^{\kappa}(\xi)+o_{\rho}(1), \tag{3.22}
\end{align*}
$$

where $\theta_{N}(x, y, \xi) \in[0, \pi]$ satisfies

$$
\cos \theta_{N}(x, y, \xi)=\left(\frac{1}{\|x\|\|y\|} \sum_{j=1}^{d} x_{j} \xi_{j}\right) \sin \frac{\|x\|}{N} \sin \frac{\|y\|}{N}+\cos \frac{\|x\|}{N} \cos \frac{\|y\|}{N}
$$

Since

$$
\begin{aligned}
\cos \theta_{N}(x, y, \xi) & =1-\frac{1}{2 N^{2}}\left(\|x\|^{2}+\|y\|^{2}-2 \sum_{j=1}^{d} x_{j} \xi_{j}\right)+O_{\|x\|,\|y\|}\left(N^{-4}\right) \\
& =1-\frac{1}{2 N^{2}} u(x, y, \xi)^{2}+O_{\|x\|,\|y\|}\left(N^{-4}\right),
\end{aligned}
$$

it follows that

$$
\begin{aligned}
\theta_{N}(x, y, \xi) & =2 \arcsin \left(\frac{1}{2 N} \sqrt{u(x, y, \xi)^{2}+O_{\|x\|,\|y\|}\left(N^{-2}\right)}\right) \\
& =\frac{1}{N} \sqrt{u(x, y, \xi)^{2}+O_{\|x\|,\|y\|}\left(N^{-2}\right)}+O_{\|x\|,\|y\|}\left(N^{-2}\right) \\
& =\frac{\rho u(x, y, \xi)+o_{\|x\|,\|y\|, \rho}(1)}{n}
\end{aligned}
$$

where the last step uses the uniform continuity of the function $t \in[0, M] \rightarrow \sqrt{t}$ for any $M>0$, and the relation $\lim _{N \rightarrow \infty} \frac{n}{N \rho}=1$.

Thus, by (3.22) and (3.15), we have

$$
\begin{aligned}
& \lim _{N \rightarrow \infty} b_{N}(\rho, x, y) \\
& =c m(\rho) \lim _{N \rightarrow \infty} \int_{\|\xi\| \leq\|y\|} n^{-2 \lambda_{\kappa}+1} C_{n}^{\lambda_{\kappa}}\left(\cos \frac{\rho u(x, y, \xi)+o_{x, y, \rho}(1)}{n}\right) d \mu_{y}^{\kappa}(\xi) \\
& =c m(\rho) \int_{\|\xi\| \leq\|y\|}(\rho u(x, y, \xi))^{-\lambda_{\kappa}+\frac{1}{2}} J_{\lambda_{\kappa}-\frac{1}{2}}(\rho u(x, y, \xi)) d \mu_{y}^{\kappa}(\xi) \\
& =c m(\rho) V_{\kappa}\left[(\rho u(x, y, \cdot))^{-\lambda_{\kappa}+\frac{1}{2}} J_{\lambda_{\kappa}-\frac{1}{2}}(\rho u(x, y, \cdot))\right](y),
\end{aligned}
$$

where we used the fact that $\left\|C_{n}^{\lambda_{\kappa}}\right\|_{\infty} \leq c n^{2 \lambda_{\kappa}-1}$, the bounded convergence theorem and (3.15) in the last step. This proves Assertion 2.

In summary, we have shown the theorem with the additional assumption $|m(t)| \leq$ $c_{1} e^{-c_{2} t}$.

Finally, we prove that the conclusion of Theorem 3.1 remains true without the additional assumption $|m(t)| \leq c_{1} e^{-c_{2} t}$. To this end, let $m_{\delta}(t)=m(t) e^{-\delta t}$ for $\delta>0$, and define $T_{m_{\delta}}: \quad L^{2}\left(\mathbb{R}^{d}, h_{\kappa}^{2}\right) \rightarrow L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ by

$$
\mathcal{F}_{\kappa}\left(T_{m_{\delta}} f\right)(\xi)=m_{\delta}(\xi) \mathcal{F}_{\kappa} f(\xi), \quad f \in L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)
$$

It is known (see [8, p. 191]) that given any $\varepsilon>0, f \mapsto \sum_{n=0}^{\infty} e^{-n \varepsilon} \operatorname{proj}_{n}^{\tilde{\kappa}} f$ is a positive operator on $L^{p}\left(\mathbb{S}^{d} ; h_{\widetilde{\kappa}}^{2}\right)$ that satisfies

$$
\sup _{\varepsilon>0}\left\|\sum_{n=0}^{\infty} e^{-n \varepsilon} \operatorname{proj}_{n}^{\tilde{\kappa}} f\right\|_{L^{p}\left(\mathbb{S}^{d} ; h_{\tilde{\kappa}}^{2}\right)} \leq\|f\|_{L^{p}\left(\mathbb{S}^{d} ; h_{\tilde{\kappa}}^{2}\right)}
$$

Indeed, this follows from [6, Theorem 4.2] and the fact that $V_{\kappa}$ is positive, which was proved in [13]. Thus, applying Theorem 3.1 for the already proven case, we have

$$
\begin{equation*}
\sup _{\delta>0}\left\|T_{m_{\delta}} f\right\|_{L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)} \leq c A\|f\|_{L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)} . \tag{3.23}
\end{equation*}
$$

On the other hand, from the definition we can decompose the operator $T_{m_{\delta}}$ as

$$
\begin{equation*}
T_{m_{\delta}} f=P_{\delta}(T f) \tag{3.24}
\end{equation*}
$$

where $\mathcal{F}_{\kappa}(T f)(\xi)=m(\|\xi\|) \mathcal{F}_{\kappa} f(\xi)$ and

$$
\mathcal{F}_{\kappa}\left(P_{\delta} f\right)(\xi)=e^{-\delta\|\xi\|} \mathcal{F}_{\kappa} f(\xi)
$$

The function $P_{\delta} f$ is called the Poisson integral of $f$, and it can be expressed as a generalized convolution (see [3])

$$
P_{\delta} f(x):=\left(f *_{\kappa} P_{\delta}\right)(x)
$$

with

$$
P_{\delta}(x):=2^{\gamma_{\kappa}+\frac{d}{2}} \frac{\Gamma\left(\gamma_{\kappa}+\frac{d+1}{2}\right)}{\sqrt{\pi}} \frac{\delta}{\left(\delta^{2}+\|x\|^{2}\right)^{\gamma_{\kappa}+\frac{d+1}{2}}} .
$$

It was shown in [3, Theorem 6.2] that

$$
\lim _{\delta \rightarrow 0+} P_{\delta} f(x)=f(x), \quad \text { a.e. } x \in \mathbb{R}^{d}
$$

for any $f \in L^{q}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ with $1 \leq q<\infty$. Since $m$ is bounded, $T f \in L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ for $f \in L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$. Thus, for any $f \in \mathcal{S}$, using (3.24),

$$
\begin{equation*}
\lim _{\delta \rightarrow 0+} T_{m_{\delta}} f(x)=\lim _{\delta \rightarrow 0+} P_{\delta}(T f)(x)=T f(x), \text { a.e. } x \in \mathbb{R}^{d} \tag{3.25}
\end{equation*}
$$

which combined with (3.23) and the Fatou theorem implies the desired estimate

$$
\|T f\|_{L^{p}\left(\mathbb{R}^{d} ; h_{k}^{2}\right)} \leq c A\|f\|_{L^{p}\left(\mathbb{R}^{d} ; h_{k}^{2}\right)}
$$

This completes the proof of the theorem.

## 4. Applications

4.1. Hörmander's multiplier theorem and the Littlewood-Paley inequality. As a first application of Theorem 3.1, we shall prove the following Hörmander type multiplier theorem:

Theorem 4.1. Let $m:(0, \infty) \rightarrow \mathbb{R}$ be a bounded function satisfying $\|m\|_{\infty} \leq A$ and Hörmander's condition

$$
\begin{equation*}
\frac{1}{R} \int_{R}^{2 R}\left|m^{(r)}(t)\right| d t \leq A R^{-r}, \quad \text { for all } R>0 \tag{4.1}
\end{equation*}
$$

where $r$ is the smallest integer $\geq \lambda_{\kappa}+1$. Let $T_{m}$ be an operator on $L^{2}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ defined by

$$
\mathcal{F}_{\kappa}\left(T_{m} f\right)(\xi)=m(\|\xi\|) \mathcal{F}_{\kappa} f(\xi), \quad \xi \in \mathbb{R}^{d}
$$

Then

$$
\left\|T_{m} f\right\|_{\kappa, p} \leq C_{p} A\|f\|_{\kappa, p}
$$

for all $1<p<\infty$ and $f \in \mathcal{S}\left(\mathbb{R}^{d}\right)$.
Proof. Let $\mu_{\ell}=m(\ell \varepsilon)$ for $\varepsilon>0$ and $\ell=0,1, \cdots$. Then

$$
\begin{aligned}
\left|\triangle^{r} \mu_{\ell}\right| & =\varepsilon^{r}\left|\int_{[0,1]^{r}} m^{(r)}\left(\varepsilon t_{1}+\cdots+\varepsilon t_{r}+\varepsilon \ell\right) d t_{1} \cdots d t_{r}\right| \\
& \leq \int_{[0, \varepsilon]^{r}}\left|m^{(r)}\left(t_{1}+\cdots+t_{r}+\varepsilon \ell\right)\right| d t_{1} \cdots d t_{r} \leq \varepsilon^{r-1} \int_{\varepsilon \ell}^{\varepsilon(r+\ell)}\left|m^{(r)}(t)\right| d t
\end{aligned}
$$

This implies that for $2^{j} \geq r$

$$
\begin{aligned}
& 2^{j(r-1)} \sum_{l=2^{j}}^{2^{j+1}}\left|\Delta^{r} \mu_{l}\right| \leq 2^{j(r-1)} \varepsilon^{r-1} \sum_{l=2^{j}}^{2^{j+1}} \int_{\varepsilon \ell}^{\varepsilon(r+\ell)}\left|m^{(r)}(t)\right| d t \\
& \leq(r-1) 2^{j(r-1)} \varepsilon^{r-1} \int_{2^{j} \varepsilon}^{\varepsilon\left(2^{j+1}+r\right)}\left|m^{(r)}(t)\right| d t \\
& \leq 2^{j(r-1)}(r-1) \varepsilon^{r-1} \int_{2^{j} \varepsilon}^{2^{j+2} \varepsilon}\left|m^{(r)}(t)\right| d t \leq c_{r} A,
\end{aligned}
$$

where the last step uses (4.1). On the other hand, however, for $2^{j} \leq r$, we have

$$
2^{j(r-1)} \sum_{l=2^{j}}^{2^{j+1}}\left|\Delta^{r} \mu_{l}\right| \leq c_{r} \max _{j}\left|\mu_{j}\right| \leq c_{r} A .
$$

Thus, using Theorem 2.3, we deduce

$$
\sup _{\varepsilon>0}\left\|\sum_{n=0}^{\infty} m(\varepsilon n) \operatorname{proj}_{n}^{\kappa^{\prime}} f\right\|_{L^{p}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right)} \leq c\|f\|_{L^{p}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right.}
$$

The desired conclusion then follows by Theorem 3.1.
Remark 4.1. Hörmander's condition is normally stated in the following form

$$
\begin{equation*}
\left(\frac{1}{R} \int_{R}^{2 R}\left|m^{(r)}(t)\right|^{2} d t\right)^{\frac{1}{2}} \leq A R^{-r}, \text { for all } R>0 \tag{4.2}
\end{equation*}
$$

See, for instance, [10, Theorem 5.2.7]. Clearly, the condition (4.1) in Theorem 4.1 is weaker than (4.2). On the other hand, however, Theorem 4.1 is applicable only to radial multiplier $m(\|\cdot\|)$.

Corollary 4.2. Let $\Phi$ be an even $C^{\infty}$-function that is supported in the set $\{x \in$ $\left.\mathbb{R}: \quad \frac{9}{10} \leq|x| \leq \frac{21}{10}\right\}$ and satisfies either

$$
\sum_{j \in \mathbb{Z}} \Phi\left(2^{-j} \xi\right)=1, \quad \xi \in \mathbb{R} \backslash\{0\}
$$

or

$$
\sum_{j \in \mathbb{Z}}\left|\Phi\left(2^{-j} \xi\right)\right|^{2}=1, \quad \xi \in \mathbb{R} \backslash\{0\}
$$

Let $\triangle_{j}$ be an operator defined by

$$
\mathcal{F}_{\kappa}\left(\triangle_{j} f\right)(\xi)=\Phi\left(2^{-j}\|\xi\|\right) \mathcal{F}_{\kappa} f(\xi), \quad \xi \in \mathbb{R}^{d}
$$

Then we have

$$
\|f\|_{\kappa, p} \sim_{\kappa, p}\left\|\left(\sum_{j \in \mathbb{Z}}\left|\triangle_{j} f\right|^{2}\right)^{\frac{1}{2}}\right\|_{\kappa, p}
$$

holds for all $f \in L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$ and $1<p<\infty$.
Proof. Corollary 4.2 follows directly from Theorem 4.1. Since the proof is quite standard (see, for instance, [17] ), we omit the details.
4.2. The Bochner-Riesz means. Given $\delta>-1$, the Bochner-Riesz means of order $\delta$ for the Dunkl transform are defined by

$$
\begin{equation*}
B_{R}^{\delta}\left(h_{\kappa}^{2} ; f\right)(x)=c \int_{\|y\| \leq R}\left(1-\frac{\|y\|^{2}}{R^{2}}\right)^{\delta} \mathcal{F}_{\kappa} f(y) E_{\kappa}(i x, y) h_{\kappa}^{2}(y) d y, \quad R>0 \tag{4.3}
\end{equation*}
$$

Convergence of the Bochner -Riesz means in the setting of Dunkl transform was studied recently by Thangavelu and Yuan Xu [19, Theorem 5.5], who proved that if $\delta>\lambda_{\kappa}:=\frac{d-1}{2}+\gamma_{\kappa}$ and $1 \leq p \leq \infty$ then

$$
\begin{equation*}
\sup _{R>0}\left\|B_{R}^{\delta}\left(h_{\kappa}^{2} ; f\right)\right\|_{\kappa, p} \leq c\|f\|_{\kappa, p} \tag{4.4}
\end{equation*}
$$

Our next result concerns the critical indices for the validity of (4.4) in the case of $G=\mathbb{Z}_{2}^{d}$ :
Theorem 4.3. Suppose that $G=\mathbb{Z}_{2}^{d}, f \in L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right), 1 \leq p \leq \infty$, and $\left|\frac{1}{p}-\frac{1}{2}\right| \geq$ $\frac{1}{2 \lambda_{\kappa}+2}$. Then (4.4) holds if and only if

$$
\begin{equation*}
\delta>\delta_{\kappa}(p):=\max \left\{\left(2 \lambda_{\kappa}+1\right)\left|\frac{1}{p}-\frac{1}{2}\right|-\frac{1}{2}, 0\right\} \tag{4.5}
\end{equation*}
$$

It should be pointed out that the result of [19, Theorem 5.5] is applicable to the case of a general finite reflection group $G$, while Theorem 4.3 above applies to the case of $\mathbb{Z}_{2}^{d}$ only.

Proof. We start with the proof of the sufficiency. Assume that $\kappa:=\left(\kappa_{1}, \cdots, \kappa_{d}\right)$ and $h_{\kappa}(x):=\prod_{j=1}^{d}\left|x_{j}\right|^{\kappa_{j}}$. Let $\kappa^{\prime}=(\kappa, 0)$ and $h_{\kappa^{\prime}}\left(x, x_{d+1}\right)=h_{\kappa}(x)$ for $x \in \mathbb{R}^{d}$ and $x_{d+1} \in \mathbb{R}$. Set $m(t)=\left(1-t^{2}\right)_{+}^{\delta}$. By the equivalence of the Riesz and the Cesàro summability methods of order $\delta \geq 0$ (see [9]), we deduce from Theorem 2.4

$$
\sup _{\varepsilon>0}\left\|\sum_{n=0}^{\infty} m(\varepsilon n) \operatorname{proj}_{n}^{\kappa^{\prime}} f\right\|_{L^{p}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right)} \leq c\|f\|_{L^{p}\left(\mathbb{S}^{d} ; h_{\kappa^{\prime}}^{2}\right)}
$$

whenever $\left|\frac{1}{p}-\frac{1}{2}\right| \geq \frac{1}{2 \sigma_{\kappa^{\prime}}+2}$ and $\delta>\delta_{\kappa^{\prime}}(p)$, where $\sigma_{\kappa^{\prime}}=\lambda_{\kappa}$ and $\delta_{\kappa^{\prime}}(p)=\delta_{\kappa}(p)$. Thus, invoking Theorem 3.1, we conclude that for $\delta>\delta_{\kappa}(p)$,

$$
\left\|B_{1}^{\delta}\left(h_{\kappa}^{2} ; f\right)\right\|_{\kappa, p} \leq c\|f\|_{\kappa, p}
$$

The estimate (4.4) then follows by dilation. This proves the sufficiency.
The necessity part of the theorem follows from the corresponding result for the Hankel transform. To see this, let $f(x)=f_{0}(\|x\|)$ be a radial function in $L^{p}\left(\mathbb{R}^{d}, h_{\kappa}^{2}\right)$. Using (4.3) and Lemma 2.2 (vii), we have

$$
B_{R}^{\delta}\left(h_{\kappa}^{2} ; f\right)(x)=\int_{0}^{R}\left(1-\frac{r^{2}}{R^{2}}\right)^{\delta} H_{\lambda_{\kappa}-\frac{1}{2}} f_{0}(r) r^{2 \lambda_{\kappa}}\left[\int_{\mathbb{S}^{d}-1} E_{\kappa}\left(i x, r y^{\prime}\right) h_{\kappa}^{2}\left(y^{\prime}\right) d \sigma\left(y^{\prime}\right)\right] d r
$$

However, by [19, Proposition 2.3] applied to $n=0$ and $g=1$, we have

$$
\int_{\mathbb{S}^{d-1}} E_{\kappa}\left(i x, r y^{\prime}\right) h_{\kappa}^{2}\left(y^{\prime}\right) d \sigma\left(y^{\prime}\right)=c\left(\frac{r\|x\|}{2}\right)^{-\lambda_{\kappa}+\frac{1}{2}} J_{\lambda_{\kappa}-\frac{1}{2}}(r\|x\|) .
$$

It follows that

$$
\begin{aligned}
B_{R}^{\delta}\left(h_{\kappa}^{2} ; f\right)(x) & =c \int_{0}^{R}\left(1-\frac{r^{2}}{R^{2}}\right)^{\delta} H_{\lambda_{\kappa}-\frac{1}{2}} f_{0}(r)\left(\frac{r\|x\|}{2}\right)^{-\lambda_{\kappa}+\frac{1}{2}} J_{\lambda_{\kappa}-\frac{1}{2}}(r\|x\|) r^{2 \lambda_{\kappa}} d r \\
& =c \widetilde{B}_{R}^{\delta} f_{0}(\|x\|)
\end{aligned}
$$

where $\widetilde{B}_{R}^{\delta}$ denotes the Bockner-Riesz mean of order $\delta$ for the Hankel transform $H_{\lambda_{\kappa}-\frac{1}{2}}$. However, it is known (see [21]) that $\widetilde{B}_{R}^{\delta}, 0<\delta<\lambda_{\kappa}$, is bounded on $L^{p}\left((0, \infty), t^{2 \lambda_{\kappa}}\right)$ if and only if

$$
\begin{equation*}
\frac{2 \lambda_{\kappa}+1}{\lambda_{\kappa}+\delta+1}<p<\frac{2 \lambda_{\kappa}+1}{\lambda_{\kappa}-\delta} \tag{4.6}
\end{equation*}
$$

Thus, to complete the proof of the necessity part of the theorem, by (4.6), we just need to observe that if $f(x)=f_{0}(\|x\|)$ is a radial function in $L^{p}\left(\mathbb{R}^{d} ; h_{\kappa}^{2}\right)$, then

$$
\|f\|_{\kappa, p}=c\left\|f_{0}\right\|_{L^{p}\left(\mathbb{R} ;|x|^{2 \lambda_{\kappa}}\right)}
$$

Remark 4.2. In the unweighted case, for the classical Fourier transform, Theorem 4.3 is well known, and in fact, it follows from the following Tomas-Stein restriction theorem (see, for instance, [10, Section 10.4]):

$$
\begin{equation*}
\|\widehat{f}\|_{L^{2}\left(\mathbb{S}^{d-1}\right)} \leq C_{p}\|f\|_{L^{p}\left(\mathbb{R}^{d}\right)}, \quad 1 \leq p \leq \frac{2 d+2}{d+3} \tag{4.7}
\end{equation*}
$$

where $\widehat{f}$ denotes the usual Fourier transform of $f$. In the weighted case, while estimates similar to (4.7) can be proved for the Dunkl transform $\mathcal{F}_{\kappa} f$ (see [12, Theorem 4.1]), they do not seem to be enough for the proof of Theorem 4.3. A similar fact was indicated in [3] for the case of the Cesàro means for h-harmonic expansions on the unit sphere, where global estimates for the projection operators have to be replaced with more delicate local estimates, which are significantly more difficult to prove than the corresponding global estimates.
