General Relativity:

- Calabi flow.
- Flow of static metrics.
- Flow of stationary metrics.

Arises from Einstein equations for Robinson-Trautman metric.

General Relativity:

- Calabi flow.
- Flow of static metrics.
- Flow of stationary metrics.

Arises from Einstein equations for Robinson-Trautman metric. Parabolic flows from Ricci flow of Lorentzian metric.

General Relativity:

- Calabi flow.
- Flow of static metrics.
- Flow of stationary metrics.
- Ricci flow on manifolds with boundary.

Arises from Einstein equations for Robinson-Trautman metric. Parabolic flows from Ricci flow of Lorentzian metric.

General Relativity:

- Calabi flow.
- Flow of static metrics.
- Flow of stationary metrics.
- Ricci flow on manifolds with boundary.

Arises from Einstein equations for Robinson-Trautman metric. Parabolic flows from Ricci flow of Lorentzian metric.

Black hole thermodynamics.

General Relativity:

- Calabi flow.
- Flow of static metrics.
- Flow of stationary metrics.
- Ricci flow on manifolds with boundary.

Quantum Gravity:

Arises from Einstein equations for Robinson-Trautman metric. Parabolic flows from Ricci flow of Lorentzian metric.

Black hole thermodynamics.

General Relativity:

- Calabi flow.
- Flow of static metrics.
- Flow of stationary metrics.
- Ricci flow on manifolds with boundary.

Arises from Einstein equations for Robinson-Trautman metric. Parabolic flows from Ricci flow of Lorentzian metric.

Black hole thermodynamics.

Quantum Gravity:

• Renormalization group flow for nonlinear sigma models.

$$\frac{\partial g_{ij}}{\partial t} = -\alpha' R_{ij} - \frac{\alpha'}{2} R_{iklm} R_j^{\ klm} + \dots$$

The two problems:

<ロ> (日) (日) (日) (日) (日)

• Tachyon condensation: the behaviour of mass under Ricci flow of asymptotically flat metrics.

< ロト < 同ト < ヨト < ヨト

- Tachyon condensation: the behaviour of mass under Ricci flow of asymptotically flat metrics.
 - Decay of tachyon: radiates closed string graviton modes.

A (10) < A (10) </p>

- Tachyon condensation: the behaviour of mass under Ricci flow of asymptotically flat metrics.
 - Decay of tachyon: radiates closed string graviton modes.
 - RG flow emulates dynamics.

▲ @ ▶ < ∃ ▶</p>

The two problems:

- Tachyon condensation: the behaviour of mass under Ricci flow of asymptotically flat metrics.
 - Decay of tachyon: radiates closed string graviton modes.
 - RG flow emulates dynamics.
 - This picture suggests that mass should decay in Ricci flow.

- Tachyon condensation: the behaviour of mass under Ricci flow of asymptotically flat metrics.
 - Decay of tachyon: radiates closed string graviton modes.
 - RG flow emulates dynamics.
 - This picture suggests that mass should decay in Ricci flow.
- Quasilocal mass: the behaviour of mass under the flow of static metrics. Two cases:

- Tachyon condensation: the behaviour of mass under Ricci flow of asymptotically flat metrics.
 - Decay of tachyon: radiates closed string graviton modes.
 - RG flow emulates dynamics.
 - This picture suggests that mass should decay in Ricci flow.
- Quasilocal mass: the behaviour of mass under the flow of static metrics. Two cases:
 - Asymptotically flat manifolds with inner boundary and Bartnik's boundary conditions.

- Tachyon condensation: the behaviour of mass under Ricci flow of asymptotically flat metrics.
 - Decay of tachyon: radiates closed string graviton modes.
 - RG flow emulates dynamics.
 - This picture suggests that mass should decay in Ricci flow.
- Quasilocal mass: the behaviour of mass under the flow of static metrics. Two cases:
 - Asymptotically flat manifolds with inner boundary and Bartnik's boundary conditions.
 - No inner boundary: complete manifold.

• Preservation of asymptotic flatness (short time existence): See Oliynyk [arxiv:math/0607438]; Dai and Ma [arxiv:math/0510083].

- Preservation of asymptotic flatness (short time existence): See Oliynyk [arxiv:math/0607438]; Dai and Ma [arxiv:math/0510083].
- ADM mass: For $\delta =$ flat background metric near infinity

$$M := \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i g_{jk} - \partial_k g_{ij} \right) d\Sigma^k(\delta)$$

- Preservation of asymptotic flatness (short time existence): See Oliynyk [arxiv:math/0607438]; Dai and Ma [arxiv:math/0510083].
- ADM mass: For $\delta =$ flat background metric near infinity

$$M := \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i g_{jk} - \partial_k g_{ij} \right) d\Sigma^k(\delta)$$

$$\frac{dM}{dt} = \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i \frac{\partial g_{jk}}{\partial t} - \partial_k \frac{\partial g_{ij}}{\partial t} \right) d\Sigma^k(\delta)$$

- Preservation of asymptotic flatness (short time existence): See Oliynyk [arxiv:math/0607438]; Dai and Ma [arxiv:math/0510083].
- ADM mass: For $\delta =$ flat background metric near infinity

$$M := \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i g_{jk} - \partial_k g_{ij} \right) d\Sigma^k(\delta)$$

$$\frac{dM}{dt} = \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i \frac{\partial g_{jk}}{\partial t} - \partial_k \frac{\partial g_{ij}}{\partial t} \right) d\Sigma^k(\delta) \; ; \; \frac{\partial g_{ij}}{\partial t} = -2R_{ij}$$

- Preservation of asymptotic flatness (short time existence): See Oliynyk [arxiv:math/0607438]; Dai and Ma [arxiv:math/0510083].
- ADM mass: For $\delta =$ flat background metric near infinity

$$M := \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i g_{jk} - \partial_k g_{ij} \right) d\Sigma^k(\delta)$$

$$\frac{dM}{dt} = \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i \frac{\partial g_{jk}}{\partial t} - \partial_k \frac{\partial g_{ij}}{\partial t} \right) d\Sigma^k(\delta) ; \quad \frac{\partial g_{ij}}{\partial t} = -2R_{ij}$$
$$= -2\lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \underbrace{(\partial_i R_{jk} - \partial_k R_{ij})}_{\Sigma_r} \underbrace{d\Sigma^k(\delta)}_{\Sigma_r}$$

- Preservation of asymptotic flatness (short time existence): See Oliynyk [arxiv:math/0607438]; Dai and Ma [arxiv:math/0510083].
- ADM mass: For $\delta =$ flat background metric near infinity

$$M := \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i g_{jk} - \partial_k g_{ij} \right) d\Sigma^k(\delta)$$

$$\frac{dM}{dt} = \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i \frac{\partial g_{jk}}{\partial t} - \partial_k \frac{\partial g_{ij}}{\partial t} \right) d\Sigma^k(\delta) ; \quad \frac{\partial g_{ij}}{\partial t} = -2R_{ij}$$
$$= -2\lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \underbrace{(\partial_i R_{jk} - \partial_k R_{ij})}_{1/r^{n+1}} \underbrace{d\Sigma^k(\delta)}_{r^{n-1}}$$

- Preservation of asymptotic flatness (short time existence): See Oliynyk [arxiv:math/0607438]; Dai and Ma [arxiv:math/0510083].
- ADM mass: For $\delta =$ flat background metric near infinity

$$M := \lim_{r \to \infty} \int_{\Sigma_r} \delta^{ij} \left(\partial_i g_{jk} - \partial_k g_{ij} \right) d\Sigma^k(\delta)$$

Short talk! ... What's the problem?

Notions of Convergence

・ロト ・聞ト ・ヨト ・ヨト

• If $M = M_0 = const$ along the flow, $\lim_{t\to\infty} M(t) = M_0$.

イロト イポト イヨト イヨト

• If $M = M_0 = const$ along the flow, $\lim_{t\to\infty} M(t) = M_0$. Initial data with nonzero mass cannot converge to flat space ... in a sufficiently strong topology (Dai and Ma).

ヘロト 不得下 不足下 不足下

- If $M = M_0 = const$ along the flow, $\lim_{t\to\infty} M(t) = M_0$. Initial data with nonzero mass cannot converge to flat space ... in a sufficiently strong topology (Dai and Ma).
- Geometric convergence, however, requires only convergence on bounded subsets.

・ロト ・ 同ト ・ ヨト ・ ヨト
- If $M = M_0 = const$ along the flow, $\lim_{t\to\infty} M(t) = M_0$. Initial data with nonzero mass cannot converge to flat space ... in a sufficiently strong topology (Dai and Ma).
- Geometric convergence, however, requires only convergence on bounded subsets.
- Analogously, in string scenario, one does not see the mass change at spatial infinity no matter how long one waits...mass change occurs at null infinity.

・ロト ・ 同ト ・ ヨト ・ ヨト

- If $M = M_0 = const$ along the flow, $\lim_{t\to\infty} M(t) = M_0$. Initial data with nonzero mass cannot converge to flat space ... in a sufficiently strong topology (Dai and Ma).
- Geometric convergence, however, requires only convergence on bounded subsets.
- Analogously, in string scenario, one does not see the mass change at spatial infinity no matter how long one waits...mass change occurs at null infinity.
- Therefore, one should track the *quasilocal mass*.

 \bullet Expanding Ricci soliton on \mathbb{R}^2 given by

$$ds^2 = t \left(f^2(r) dr^2 + r^2 \zeta^2 d\theta^2 \right) \;,\; \zeta = const.$$

 \bullet Expanding Ricci soliton on \mathbb{R}^2 given by

$$ds^2 = t\left(f^2(r)dr^2 + r^2\zeta^2d\theta^2
ight) \ , \ \zeta = const.$$

• Changing coordinates to $\rho = r\sqrt{t}$, we get

$$ds^2=f^2(
ho/\sqrt{t})d
ho^2+
ho^2\zeta^2d heta^2$$
 .

• Expanding Ricci soliton on \mathbb{R}^2 given by

$$ds^2 = t\left(f^2(r)dr^2 + r^2\zeta^2d\theta^2
ight) \ , \ \zeta = const.$$

• Changing coordinates to $\rho = r\sqrt{t}$, we get

$$ds^2 = f^2(
ho/\sqrt{t})d
ho^2 +
ho^2\zeta^2d heta^2$$

• f(x) is given implicitly by

$$\left(\frac{1}{\zeta} - 1\right) \exp\left(\frac{1}{\zeta} - 1 - \frac{x^2}{2\alpha'}\right) = \left(\frac{1}{f(x)} - 1\right) \exp\left(\frac{1}{f(x)} - 1\right)$$

 \bullet Expanding Ricci soliton on \mathbb{R}^2 given by

$$ds^2 = t\left(f^2(r)dr^2 + r^2\zeta^2d\theta^2
ight) \ , \ \zeta = const.$$

• Changing coordinates to $\rho = r\sqrt{t}$, we get

$$ds^2=f^2(
ho/\sqrt{t})d
ho^2+
ho^2\zeta^2d heta^2$$
 .

$$\left(\frac{1}{\zeta} - 1\right) \exp\left(\frac{1}{\zeta} - 1 - \frac{x^2}{2\alpha'}\right) = \left(\frac{1}{f(x)} - 1\right) \exp\left(\frac{1}{f(x)} - 1\right)$$

•
$$f(x) \rightarrow \zeta$$
 for $x \searrow 0$.
• $f(x) \rightarrow 1$ for $x \nearrow \infty$.
• f is monotonic on $(0, \infty)$.

$$ds^{2} = t \left(f^{2}(r)dr^{2} + r^{2}\zeta^{2}d\theta^{2} \right)$$
$$= f^{2}(\rho/\sqrt{t})d\rho^{2} + \rho^{2}\zeta^{2}d\theta^{2}$$

・ロト ・聞ト ・ヨト ・ヨト

$$ds^{2} = t \left(f^{2}(r)dr^{2} + r^{2}\zeta^{2}d\theta^{2} \right)$$
$$= f^{2}(\rho/\sqrt{t})d\rho^{2} + \rho^{2}\zeta^{2}d\theta^{2}$$

 Asymptotic deficit angle is 2D mass (hint: think of isoperimetric deficit).

-

Sept 2008 8 / 23

$$ds^2 = t \left(f^2(r) dr^2 + r^2 \zeta^2 d\theta^2 \right)$$

= $f^2(\rho/\sqrt{t}) d\rho^2 + \rho^2 \zeta^2 d\theta^2$

- Asymptotic deficit angle is 2D mass (hint: think of isoperimetric deficit).
- At fixed t, the $\rho \to \infty$ limit is flat cone of deficit angle $\delta = 2\pi(1-\zeta)$.

< 🗇 🕨 < 🖃 🕨

$$ds^2 = t \left(f^2(r) dr^2 + r^2 \zeta^2 d\theta^2 \right)$$

= $f^2(\rho/\sqrt{t}) d\rho^2 + \rho^2 \zeta^2 d\theta^2$

- Asymptotic deficit angle is 2D mass (hint: think of isoperimetric deficit).
- At fixed t, the $\rho \to \infty$ limit is flat cone of deficit angle $\delta = 2\pi(1-\zeta)$.
- At fixed ρ , the $t \to \infty$ limit is flat space.

GHMS soliton

Lessons Learned

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ● ●

• Mass (deficit angle) constant along flow.

- Mass (deficit angle) constant along flow.
- Geometric limit is flat space; mass jumps to zero.

- Mass (deficit angle) constant along flow.
- Geometric limit is flat space; mass jumps to zero.
- Quasi-local mass evaporates smoothly; evaporation occurs primarily on distance scales $r < \sqrt{t}$.

Lessons Learned

- Mass (deficit angle) constant along flow.
- Geometric limit is flat space; mass jumps to zero.
- Quasi-local mass evaporates smoothly; evaporation occurs primarily on distance scales $r < \sqrt{t}$.
- Agrees with qualitative "rolling tachyon" predictions in string theory.

- Mass (deficit angle) constant along flow.
- Geometric limit is flat space; mass jumps to zero.
- Quasi-local mass evaporates smoothly; evaporation occurs primarily on distance scales $r < \sqrt{t}$.
- Agrees with qualitative "rolling tachyon" predictions in string theory.

• f is equivalent to Brown-York quasilocal mass

$$\mu[\Sigma] := \int_{\Sigma} (H_0 - H) \, d\Sigma$$

Image: A image: A

• f is equivalent to Brown-York quasilocal mass

$$\mu[\Sigma] := \int_{\Sigma} \left(H_0 - H\right) d\Sigma = c_n r^{n-2} \left(1 - \frac{1}{f(t,r)}\right)$$

 Σ = sphere of coordinate radius r, $c_n = vol(\mathbb{S}^{n-1}, can)$.

• f is equivalent to Brown-York quasilocal mass

$$\mu[\Sigma] := \int_{\Sigma} \left(H_0 - H\right) d\Sigma = c_n r^{n-2} \left(1 - \frac{1}{f(t,r)}\right)$$

 Σ = sphere of coordinate radius r, $c_n = vol(\mathbb{S}^{n-1}, can)$.

• f and $\frac{\partial f}{\partial r}$ give the sectional curvatures:

• f is equivalent to Brown-York quasilocal mass

$$\mu[\Sigma] := \int_{\Sigma} \left(H_0 - H\right) d\Sigma = c_n r^{n-2} \left(1 - \frac{1}{f(t,r)}\right)$$

 Σ = sphere of coordinate radius r, $c_n = vol(\mathbb{S}^{n-1}, can)$.

•
$$f$$
 and $\frac{\partial f}{\partial r}$ give the sectional curvatures:
• $\kappa_1 = \frac{1}{rf^3} \frac{\partial f}{\partial r} = \frac{1}{c_n rf} \frac{\partial}{\partial r} \frac{\mu}{r^{n-2}}$: curvature in planes containing $\frac{\partial}{\partial r}$.

• f is equivalent to Brown-York quasilocal mass

$$\mu[\Sigma] := \int_{\Sigma} \left(H_0 - H\right) d\Sigma = c_n r^{n-2} \left(1 - \frac{1}{f(t,r)}\right)$$

 Σ = sphere of coordinate radius r, $c_n = vol(\mathbb{S}^{n-1}, can)$.

• f is equivalent to Brown-York quasilocal mass

$$\mu[\Sigma] := \int_{\Sigma} (H_0 - H) d\Sigma = c_n r^{n-2} \left(1 - \frac{1}{f(t, r)} \right)$$

 Σ = sphere of coordinate radius r, $c_n = vol(\mathbb{S}^{n-1}, can)$.

• f is equivalent to Brown-York quasilocal mass

$$\mu[\Sigma] := \int_{\Sigma} \left(H_0 - H\right) d\Sigma = c_n r^{n-2} \left(1 - \frac{1}{f(t,r)}\right)$$

 Σ = sphere of coordinate radius r, $c_n = vol(\mathbb{S}^{n-1}, can)$.

• PDE for f implies
$$f \sim 1 + \frac{const}{(1+t)}$$
, $t \to \infty$, so $\mu(t, r) \to 0 \ \forall r$.

• f is equivalent to Brown-York quasilocal mass

$$\mu[\Sigma] := \int_{\Sigma} \left(H_0 - H\right) d\Sigma = c_n r^{n-2} \left(1 - \frac{1}{f(t,r)}\right)$$

 Σ = sphere of coordinate radius r, $c_n = vol(\mathbb{S}^{n-1}, can)$.

- PDE for f implies $f \sim 1 + \frac{const}{(1+t)}$, $t \to \infty$, so $\mu(t, r) \to 0 \ \forall r$.
- Likewise κ₁, κ₂ and all derivatives → 0; flow converges geometrically to flat space.

Begin with metric

$$dS^2=G_{\mu
u}dx^\mu dx^
u=e^{2k_nu}d au^2+g_{ij}dx^i dx^j$$

with

$$rac{\partial u}{\partial au} = 0 \ , \ rac{\partial g_{ij}}{\partial au} = 0 .$$

$$X:=-k_n\nabla^i u\frac{\partial}{\partial x^i}.$$

Apply Hamilton-DeTurck flow

$$rac{\partial {\sf G}_{\mu
u}}{\partial\lambda} = -2{\sf R}^{\sf G}_{\mu
u} + {\cal L}_X{\sf G}_{\mu
u}.$$

• This yields the static metric flow equations of the last slide.

Rotationally Symmetric Case

イロト イポト イヨト イヨト

Rotationally Symmetric Case

• What are the rotationally symmetric solutions of List's flow?

Image: A = A = A

- What are the rotationally symmetric solutions of List's flow?
- Special case: no minimal spheres:

$$ds^2 = f^2(\lambda, r)dr^2 + r^2 d\Omega^2$$
, $u = u(\lambda, r)$.

- What are the rotationally symmetric solutions of List's flow?
- Special case: no minimal spheres:

$$ds^2 = f^2(\lambda, r)dr^2 + r^2 d\Omega^2$$
, $u = u(\lambda, r)$.

 Above condition implies manifold is noncompact, so assume asymptotic flatness.

- What are the rotationally symmetric solutions of List's flow?
- Special case: no minimal spheres:

$$ds^2 = f^2(\lambda, r)dr^2 + r^2 d\Omega^2$$
, $u = u(\lambda, r)$.

- Above condition implies manifold is noncompact, so assume asymptotic flatness.
- Assume complete manifold with no inner boundary: limiting case of Bartnik's problem.

Problem:

Say (M, g(0)) is asymptotically flat. Are there solutions (M, g(t), u(t)) of

$$\frac{\partial f}{\partial t} = \frac{1}{f^2} \frac{\partial^2 f}{\partial r^2} - \frac{2}{f^3} \left(\frac{\partial f}{\partial r}\right)^2 + \left(\frac{(n-2)}{r} - \frac{1}{rf^2}\right) \frac{\partial f}{\partial r} - \frac{(n-2)}{r^2 f} \left(f^2 - 1\right) + \frac{k_n^2}{f} \left(\frac{\partial u}{\partial r}\right)^2 \frac{\partial u}{\partial t} = \Delta u + \mathcal{L}_X u$$

$$\frac{d}{\partial t} = \Delta u + \mathcal{L}_X u$$
$$= \frac{1}{f^2} \frac{\partial^2 u}{\partial r^2} + \left[\frac{1}{rf^2} - \frac{1}{f^3} \frac{\partial f}{\partial r} + \frac{n-2}{r}\right] \frac{\partial u}{\partial r}$$

for $t \in [0, \infty)$ and, if so, does (M, g(t)) converge geometrically to some (M_{∞}, g_{∞}) , and does u(t) converge?

Eric Woolgar (University of Alberta) Two geometric flow problems arising from the

- Bounds on $|\nabla u|$:
 - List: $|\nabla u|$ decays at least as $1/\sqrt{t}$.
 - *u* stays smooth at origin: $\frac{1}{r} |\nabla u| < const.$
- Bounds on *f* :
 - Bound below: $f(t, r) \ge const$ depending only on initial data f(0, r) and, for n = 2, the limit of f as $r \to \infty$.

- Bounds on $|\nabla u|$:
 - List: $|\nabla u|$ decays at least as $1/\sqrt{t}$.
 - *u* stays smooth at origin: $\frac{1}{r} |\nabla u| < const.$
- Bounds on *f* :
 - Bound below: $f(t, r) \ge const$ depending only on initial data f(0, r) and, for n = 2, the limit of f as $r \to \infty$.
 - Bound above: $f(t, r) < const \cdot (1 + t)^{p/2}$, p > 0 depends on $|\nabla u|_{(0,r)}$. In particular, $f < e^t$.

- Bounds on $|\nabla u|$:
 - List: $|\nabla u|$ decays at least as $1/\sqrt{t}$.
 - *u* stays smooth at origin: $\frac{1}{r} |\nabla u| < const.$
- Bounds on *f* :
 - Bound below: $f(t, r) \ge const$ depending only on initial data f(0, r) and, for n = 2, the limit of f as $r \to \infty$.
 - Bound above: $f(t, r) < const \cdot (1 + t)^{p/2}$, p > 0 depends on $|\nabla u|_{(0,r)}$. In particular, $f < e^t$.
- Thus expect existence for all t > 0, but not always convergence on \mathbb{R}^n .
