

Algorithm Discovery and Design

Chapter 2

Topics:

Representing Algorithms
Algorithmic Problem Solving

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 1

Why are Algorithms Important?

If we can discover an algorithm to perform a task, we can instruct a *computing agent* to execute it and solve the problem for us.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 2

Representing Algorithms

- What language to use?
 - Expressive.
 - Clear, precise, and unambiguous.
- For example, we could use:
 - Natural language (e.g. English).
 - Formal programming languages (e.g. C++).
 - Something else?

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 3

Example: Adding 2 numbers

• Assume we know how to add 2 single digit numbers, but want to write an algorithm to add any 2 numbers:

$$\begin{array}{r}
 1 \\
 182 \\
 + 263 \\
 \hline
 445
 \end{array}$$

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 4

Example using Natural Language

Initially, set the value of the variable carry to 0. When these initializations have been completed, begin looping until the value of the variable i becomes greater than m-1. First add together the values of the two digits a_i and b_i and the current value of the carry digit to get the result called c_i . Now check the value of c_i to see whether it is greater than or equal to 10. If c_i is greater than or equal to 10, then ...

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 5

Natural Languages

- English or some other natural language.
- Are **not** particularly good:
 - too verbose
 - unstructured
 - too rich in interpretation (ambiguous)
 - imprecise

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 6

Example using Programming Language

```
{
int I, m, Carry;
int a[100], b[100], c[100];
cin >> m;
for ( int j = 0 ; k <= m-1 ; j++ ) {
    cin >> a[j];
    cin >> b[j];
}
Carry = 0;
i = 0;
while ( i < m ) { ...
```

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 7

Programming Languages

- Are not particularly good either:
 - Too many implementation details to worry about
 - Too rigid syntax
- Easy to lose sight of the real task
 - We don't see the forest because of all the trees!

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 8

Pseudo-code

- We need a compromise between the two:
 - Pseudo-code
- Computer scientists use pseudo-code to express algorithms:
 - English like constructs (or other natural language), but
 - modeled to look like statements in typical programming languages.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 9

Pseudo-code for the Addition Algorithm

Step	Operation
1	Get the value of a_{m-1}, \dots, a_0
2	Get the value of b_{m-1}, \dots, b_0
3	Set the value of <i>carry</i> to 0
4	Set the value of <i>i</i> to 0
5	Repeat steps 6-8 until <i>i</i> greater than $m-1$
6	Set the value of c_i to $a_i + b_i + \textit{carry}$
7	If $c_i \geq 10$, then set c_i to $c_i - 10$ and <i>carry</i> to 1; otherwise set the value of <i>carry</i> to 0
8	Set value of <i>i</i> to $i + 1$ (look at next digit)
9	Set c_m to <i>carry</i>
10	Print out the final answer c_m, c_{m-1}, \dots, c_0
11	Stop.

- What kind of operations do we need?**
- Getting input and producing output
 - Get the two numbers
 - Display the outcome
 - Referring to values within our algorithm
 - Add together the rightmost digits of the two numbers
 - Add together a_0 and b_0
 - Doing something if some condition is true
 - If the outcome is greater or equal to 10 then ...
 - Doing something repeatedly
 - Do this for all the digits in the numbers ...
- CMPUT101 Introduction to Computing (c) Yingxi Björnsson & Jia You 11

- Pseudo-code Primitives**
- Three basic kind of operations:
- Sequential
 - Computation (Set ...)
 - Input/Output (Get ... / Print ...)
 - Conditional
 - If ... Else
 - If ...
 - Iterative / looping
 - Repeat ...
 - While ...
- CMPUT101 Introduction to Computing (c) Yingxi Björnsson & Jia You 12

Computation

General format:

Set the value of <variable> to <expression>

Performs a computation and stores the result.

Example:

Set the value of *C* to $(A + B)$

Set the value of *location* to 0

Set the value of *GPA* to $(sum / count)$

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 13

Variables

A variable is a named storage.

- A value can be stored into it, overwriting the previous value

- Its value can be copied

Examples:

Set the value of *A* to 3

The variable *A* holds the value 3 after its execution

Set the value of *A* to $(A+1)$

Same as: add 1 to the value of *A* (*A* is now 4)

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 14

Not too Strict on Syntax

• Pseudo-code is kind of a programming language without a rigid syntax, for example we can write:

– Set the value of *A* to $(B+C)$

• as

– Set *A* to $(B+C)$

• Or even:

• Set the value of *sum* to 0

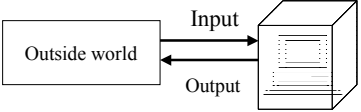

• Set the value of *GPA* to 0

• as

• Set *sum* and *GPA* to 0

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 15

Sequential Operations - Input/Output

- The computing agent (computer) needs to communicate with the outside world:
 - INPUT operations allow the computing agent to receive from the outside world data values to use in subsequent computations.
 - OUTPUT operations allow the computing agent to communicate results of computations to the outside world.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 16

Input

General format:

Get a value for <variable>

The computing agent (computer) suspends executions and waits for an input value.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 17

Input - Examples

- Examples:
 - Get value for *grade*
 - Get values for N, M
- Can write:
 - Get value for N_1
 - ...
 - Get value for N_{100}
- as
 - Get value for N_1, \dots, N_{100}

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 18

Output

General format:

Print the value of <variable>
Print the message, "<text>"

The computing agent (computer) displays the value of the variable(s).

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 19

Output - Examples

- Examples:
 - Print the value of *grade*
 - Print the message, "Hello"
- Can write:
 - Print the value of N_1
 - ...
 - Print the value of N_{100}
- as
 - Print the values of N_1, \dots, N_{100}

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 20

Example

- Write an algorithm to calculate the average of three numbers.

Steps	Operations
1	Get values for N_1 , N_2 , and N_3
2	Set the value of <i>Average</i> to $(N_1+N_2+N_3)/3$
3	Print the value of <i>Average</i>
4	Stop

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 21

Conditional Operations

If *<condition>* then
 operations for the then-part
Else
 operations for the else-part

1. Evaluate *<condition>* expression to see whether it is true or false.
2. If true, then execute operations in then-part
3. Otherwise, execute operations in else-part.

Conditions, or Boolean Expressions

• A *condition* is one whose value is true or false, for example:

- $3 > 2$ is greater than (true)
- $3 = 2$ is equal to (false)
- $A > 2$ is true if *A*'s value is greater than 2 (at the time this is executed), false otherwise.

Conditions may be compounded

E1 or E2
true if at least one of them is true; false otherwise.

E.g. $3 > 2$ or $2 > 3$ is true

E1 and E2
true if both are true; false otherwise

E.g. $3 > 2$ and $2 > 3$ is false

not E
true if E is false, false if E is true

Example

1. Get a value for *A*
2. If $A = 0$ then
3. Print the message, "The input is zero"
- Else
4. Print the message, "The input is not zero"

1. Get a value for *grade*
2. If $grade < 1$ or $grade > 9$ then
3. Print the message, "Invalid grade"
- Else
4. Set the value of *total* to $(grade + total)$

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 25

Iterative Operations - Repeat

Repeat steps *i* to *j* until <condition> becomes true

step *i*: operation

step *i*+1: operation

...

step *j*: operation

1. Execute steps *i* to *j*
2. Evaluate <condition>
3. If condition is false, go back to 1.
4. Otherwise, continue execution from step *j*+1.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 26

Example

- 1 Get a value for *count*
- 2 Repeat steps 3 to 5 until $(count > 10)$
- 3 Set *square* to $(count * count)$
- 4 Print the values of *count* and *square*
- 5 Add 1 to *count*

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 27

Repeat Loops

What happens when it gets executed?

If initial value for *count* is 8, we get printout

```
8 64
9 81
10 100
```

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 28

Repeat Loops

If initial value for *count* is 11, we get printout

```
11 121
```

Why?

Because the body is executed once before any test is done!

If need to execute loop 0 or more times we should use While-loops.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 29

Iterative Operation - While

While <condition> remains true do steps i to j

```
step i: operation
step i+1: operation
...
step j: operation
```

 1. Evaluate <condition>
2. If condition is true, execute steps i to j, then go back to 1.
3. Otherwise, if condition is false, continue execution from step j+1.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 30

Example

```

1  Get a value for count
2  While count < 10 do
3      Set square to (count * count)
4      Print the values of count and square
5      Add 1 to count
6  Stop
    
```

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 31

While Loops

What happens when it gets executed?

If *count* starts with 7, we get printout

```

7 49
8 64
9 81
    
```

What if *count* starts with 11?

Nothing is printed, loop is executed 0 times.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 32

Example: Multiply (via addition)

Steps	Operations
1	Get values for <i>N</i> and <i>M</i>
2	Set the value of <i>Result</i> to 0
3	While <i>M</i> > 0 do steps 4 and 5
4	Add <i>N</i> to the value of <i>Result</i>
5	Subtract 1 from <i>M</i>
6	Print the value of <i>Result</i>
7	Stop

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 33

N * M Example

Suppose initially $N = 3$ and $M = 4$.
 During computation, the variable *Result* held the following values, in that order:

Result:	0
	3
	6
	9
	12

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 34

Infinite Loops

Danger:
 A loop can be infinite due to non-changing conditions¹

<p>Example 1: Repeat until $2 > 3$ loop body $2 > 3$ is false all the time.</p>	<p>Example 2: While $3 > 2$ do loop body $3 > 2$ true all the time.</p>
---	---

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 35

Why do these two algorithms not terminate?

<ol style="list-style-type: none"> 1. Set the value of i to 1 2. While $i < 10$ do step 3 3. Print value of i 4. Stop 	
<ol style="list-style-type: none"> 1. Set the value of A to 1 2. While A is an odd number do 3. Add 2 to the value of A 4. Print the value of A 5. Stop 	

36

Addition Algorithm Revisited	
Step	Operation
1	Get the value of a_{m-1}, \dots, a_0
2	Get the value of b_{m-1}, \dots, b_0
3	Set the value of <i>carry</i> to 0
4	Set the value of <i>i</i> to 0
5	Repeat steps 6-8 until <i>i</i> greater than $m-1$
6	Set the value of c_i to $a_i + b_i + \textit{carry}$
7	If $c_i \geq 10$, then set c_i to $c_i - 10$ and <i>carry</i> to 1; otherwise set the value of <i>carry</i> to 0
8	Set value of <i>i</i> to $i + 1$ (look at next digit)
9	Set c_m to <i>carry</i>
10	Print out the final answer c_m, c_{m-1}, \dots, c_0
11	Stop.

Summary of Pseudocode	
<u>Sequential</u>	
Set the value of <i>variable</i> to <i>expression</i>	
<u>Input and Output</u>	
Get a value	Print
<u>Conditional</u>	
If a <i>condition</i> is true then	
the first set of operations	
else	
the second set of operations	
<small>CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 38</small>	

Summary of Pseudocode	
<u>Iterative:</u>	
Repeat until a condition becomes true	
the loop body	
While a condition remains true do	
the loop body	
<small>CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 39</small>	

Exercises

I. Compute the average of 3 grades (1-9); if any one is 0 or negative, a message "Bad data" is printed

```
Get values for x, y, z
If x < 1 or y < 1 or z < 1 then
    Print message, "Bad data"
Else
    Set Average to (x + y + z) / 3
    Print the value of Average
Stop
```

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 40

Exercises

II. Compute the sum of n integers where $n > 0$

```
Get value for n, the number of integers
Get values for  $l_1, l_2, \dots, l_n$ , a list of  $n$  integers
Set the value of Sum to 0
Set the value of k to 1
Repeat until  $k > n$ 
    Add  $l_k$  to Sum
    Add 1 to k
End of the loop
Print the value of Sum
Stop
```

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 41

Exercises

III. What does the following algorithm do?

```
Repeat until  $A > 0$ 
    Print message, "Enter an integer"
    Get a value for A
End of the loop
Stop
```

IV. Write an algorithm that does the same but using a while loop instead of a repeat loop.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 42

RECALL: Algorithms & Computing Agents

If we can discover an algorithm to perform a task, we can instruct a *computing agent* to execute it to solve the problem for us.

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 43

Algorithmic Problem Solving

Algorithm discovery

The process of finding a solution to a given problem

Typical Steps:

1. Understand the problem
2. Divide it into sub-problems
3. Sketch and refine, probably repeatedly
4. Test the correctness

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 44

Sequential search: an Example

Find the phone number of a given *Name* in an (unsorted) list of names and their phone numbers

<u>Names</u>	<u>Phone numbers</u>
N_1	T_1
N_2	T_2
...	
N_{1000}	T_{1000}

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 45

Sequential search: 1st Attempt

1. Get values for $Name, N_1, \dots, N_{1000}, T_1, \dots, T_{1000}$
2. If $Name = N_1$ then print the value of T_1
3. If $Name = N_2$ then print the value of T_2
- ...
1000. If $Name = N_{999}$ then print the value of T_{999}
1001. If $Name = N_{1000}$ then print the value of T_{1000}
1002. Stop

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 46

Sequential search: Using A Loop

```

Get values for  $Name, N_1, \dots, N_{1000}, T_1, \dots, T_{1000}$ 
Set the value  $i$  to 1 and the value of  $Found$  to NO
Repeat until  $Found = \text{Yes}$  or  $i > 1000$ 
  If  $Name = N_i$  then
    Print the value of  $T_i$ 
    Set the value of  $Found$  to YES
  Else
    Add 1 to the value of  $i$ 
End of loop
Stop
    
```

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 47

Selection: Find The Largest Number

Given a list of variables A_1, A_2, \dots, A_n , find the largest value and its (first) location

Location	A_1	A_2	A_3	A_4	A_5	A_6	A_7
Value	5	2	8	4	8	6	4

The largest is 8 at location 3

Idea (sketch): Go through the entire list, at each iteration find the *largest-so-far* and record its *location*

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 48

i							
↓							
Location	A1	A2	A3	A4	A5	A6	A7
Value	5	2	8	4	8	6	4

To begin with,
 set *largest-so-far* to (the value of) **A1**
 set *location* to 1
 set *i* to 2

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 49

i							
↓							
Location	A1	A2	A3	A4	A5	A6	A7
Value	5	2	8	4	8	6	4

Compare **A1** and **A2**
largest-so-far still holds the value of **A1**
 set *i* to *i*+1

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 50

i							
↓							
Location	A1	A2	A3	A4	A5	A6	A7
Value	5	2	8	4	8	6	4

Compare **A1** and **A3**
largest-so-far now holds the value of **A3**
location is 3
 set *i* to *i*+1

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 51

Location	<i>A1</i>	<i>A2</i>	<i>A3</i>	<i>A4</i>	<i>A5</i>	<i>A6</i>	<i>A7</i>
Value	5	2	8	4	8	6	4

i

Continue the similar process until $i = 8$

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 52

Selection: Find The Largest Number

Get a value for n , the size of the list
 Get values for A_1, A_2, \dots, A_n , the list to be searched
 Set *largest_so_far* to A_1 and set *location* to 1
 Set the value of i to 2
 While i is less or equal to n do
 If $A_i > largest_so_far$ then
 Set the value of *largest_so_far* to A_i
 Set the value of *location* to i
 Add 1 to the value of i
 End of loop
 Print the values of *largest_so_far* and *location*

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 53

Algorithmic Problem Solving: Summary

Two examples of algorithmic problem solving

- Sequential search
 - Q: On the average, how many comparisons (of names) does the algorithm make?
- Selection
 - Q: Design a similar algorithm to find
 - the smallest value and its first location
 - the largest and all the locations holding it

CMPUT101 Introduction to Computing (c) Yngvi Björnsson & Jia You 54
