

Chapter 5 The Von Neumann Architecture

Memory Subsystem

· Memory, also called RAM (Random Access Memory),

- Consists of many memory cells (storage units) of a fixed size.
 Each cell has an address associated with it: 0, 1, ...
- All accesses to memory are to a specified address.
 A cell is the minimum unit of access (fetch/store a complete cell).

(c) Yngvi Bjornsson

5

- The time it takes to fetch/store a cell is the same for all cells.
- When the computer is running, both
 - Program
 - Data (variables)

CMPUT101 Introduction to Computing

are stored in the memory.

Operations on Memory

- · Fetch (address):
 - Fetch a copy of the content of memory cell with the specified address.
 - Non-destructive, copies value in memory cell.
- Store (address, value):
 - Store the specified value into the memory cell specified by address.
 Destructive, overwrites the previous value of the memory cell.

(c) Yngvi Bjornsson

8

- Destructive, overwrites the previous value of the memory
- The memory system is interfaced via:
 - Memory Address Register (MAR)
 - Memory Data Register (MDR)
- Fetch/Store signal CMPUT101 Introduction to Computing

Input/Output Subsystem

- Handles devices that allow the computer system to:
 Communicate and interact with the outside world
 - Screen, keyboard, printer, ...
 Store information (mass-storage)
 - Hard-drives, floppies, CD, tapes, ...
- Mass-Storage Device Access Methods:
 - Direct Access Storage Devices (DASDs)
 - · Hard-drives, floppy-disks, CD-ROMs, ...
- Sequential Access Storage Devices (SASDs)
 Tapes (for example, used as backup devices)

I/O Controllers
Speed of I/O devices is slow compared to RAM

RAM
S0 nsec.
Hard-Drive ~ 10msec. = (10,000,000 nsec)

Solution:

I/O Controller, a special purpose processor:
Has a small memory buffer, and a control logic to control I/O device (e.g. move disk arm).
Sends an interrupt signal to CPU when done read/write.
Data transferred between RAM and memory buffer.
Processor free to do something else while I/O controller reads/writes data from/to device into I/O buffer.

(c) Yngvi Bjornsson

CMPUT101 Introduction to Computing

(c) Yngvi Bjornsson

- Circuits to do the arithmetic/logic operations.
- Registers (fast storage units) to store intermediate computational results.
- Bus that connects the two.

CMPUT101 Introduction to Computing

The Control Unit

- · Program is stored in memory
 - as machine language instructions, in binary
- The task of the <u>control unit</u> is to execute programs by repeatedly:
 - <u>Fetch</u> from memory the next instruction to be executed.

(c) Yngvi Bjornsson

- <u>Decode</u> it, that is, determine what is to be done.
- Execute it by issuing the appropriate signals to the
- ALU, memory, and I/O subsystems.
- Continues until the HALT instruction

CMPUT101 Introduction to Computing

· Fetch phase

- PC --> MAR (put address in PC into MAR)
- Fetch signal (signal memory to fetch value into MDR)
- MDR --> IR (m
 - > IR (move value to Instruction Register)
- PC + 1 --> PC (Increase address in program counter)

Decode Phase

- IR -> Instruction decoder (decode instruction in IR)
- Instruction decoder will then generate the signals to activate the circuitry to carry out the instruction

Opcode	Operation	Meaning
0000	LOAD X	CON(X)> R
0001	STORE X	R> CON(X)
0010	CLEAR X	0> CON(X)
0011	ADD X	R + CON(X)> R
0100	INCREMENT X	CON(X) + 1> CON(X)
0101	SUBTRACT X	R - CON(X)> R
0101	DECREMENT X	CON(X) - 1> CON(X)
0111	COMPARE X	If CON(X) > R then GT = 1 else 0
		If CON(X) = R then EQ = 1 else 0
		If CON(X) < R then LT = 1 else 0
1000	JUMP X	Get next instruction from memory location X
1001	JUMPGT X	Get next instruction from memory loc. X if GT=1
	JUMPxx X	xx = LT / EQ / NEQ
1101	IN X	Input an integer value and store in X
1110	OUT X	Output, in decimal notation, content of mem. loc.
1111	HALT	Stop program execution
